1 TMS320F2806x (Piccolo™) MCUs

1.1 Features

- **High-Efficiency 32-Bit CPU (TMS320C28x™)**
 - 80 MHz (12.5-ns Cycle Time)
 - 16 x 16 and 32 x 32 MAC Operations
 - 16 x 16 Dual MAC
 - Harvard Bus Architecture
 - Atomic Operations
 - Fast Interrupt Response and Processing
 - Unified Memory Programming Model
 - Code-Efficient (in C/C++ and Assembly)
- **Floating-Point Unit**
 - Native Single-Precision Floating-Point Operations
- **Programmable Control Law Accelerator (CLA)**
 - 32-Bit Floating-Point Math Accelerator
 - Executes Code Independently of the Main CPU
- **Viterbi, Complex Math, CRC Unit (VCU)**
 - Extends C28x™ Instruction Set to Support Complex Multiply, Viterbi Operations, and Cyclic Redundancy Check (CRC)
- **Embedded Memory**
 - Up to 256KB Flash
 - Up to 100KB RAM
 - 2KB OTP ROM
- **6-Channel DMA**
- **Low Device and System Cost**
 - Single 3.3-V Supply
 - No Power Sequencing Requirement
 - Integrated Power-on Reset and Brown-out Reset
 - Low-Power Operating Modes
 - No Analog Support Pin
- **Clocking**
 - Two Internal Zero-pin Oscillators
 - On-Chip Crystal Oscillator/External Clock Input
 - Dynamic PLL Ratio Changes Supported
 - Watchdog Timer Module
 - Missing Clock Detection Circuitry
- **Peripheral Interrupt Expansion (PIE) Block That Supports All Peripheral Interrupts**
- **Three 32-Bit CPU Timers**
- **Advanced Control Peripherals**
- **Up to 8 Enhanced Pulse Width Modulator (ePWM) Modules**
 - 16 PWM Channels Total (8 HRPWM-Capable)
 - Independent 16-Bit Timer in Each Module
- **3 Input Capture (eCAP) Modules**
- **4 High-Resolution Input Capture (HRCAP) Modules**
- **2 Quadrature Encoder (eQEP) Modules**
- **12-Bit ADC, Dual Sample-and-Hold**
 - Up to 3 MSPS
 - Up to 16 Channels
- **On-Chip Temperature Sensor**
- **128-Bit Security Key/Lock**
 - Protects Secure Memory Blocks
 - Prevents Firmware Reverse Engineering
- **Serial Port Peripherals**
 - Up to Two Serial Communications Interface (SCI) [UART] Modules
 - Two Serial Peripheral Interface (SPI) Modules
 - One Inter-Integrated-Circuit (I2C) Bus
 - One Multi-Channel Buffered Serial Port (McBSP) Bus
 - One Enhanced Controller Area Network (eCAN)
- **Up to 54 Individually Programmable, Multiplexed GPIO Pins With Input Filtering**
- **Advanced Emulation Features**
 - Analysis and Breakpoint Functions
 - Real-Time Debug via Hardware
- **2806x Packages**
 - 80-Pin PFP and 100-Pin PZP PowerPAD™ Low-Profile Quad Flatpacks (LQFPs)
 - 80-Pin PN and 100-Pin PZ LQFPs

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

1.2 Description

The F2806x Piccolo™ family of microcontrollers provides the power of the C28x™ core and Control Law Accelerator (CLA) coupled with highly integrated control peripherals in low pin-count devices. This family is code-compatible with previous C28x-based code, as well as providing a high level of analog integration.

An internal voltage regulator allows for single-rail operation. Enhancements have been made to the HRPWM module to allow for dual-edge control (frequency modulation). Analog comparators with internal 10-bit references have been added and can be routed directly to control the PWM outputs. The ADC converts from 0 to 3.3-V fixed full scale range and supports ratio-metric V_{REFHI}/V_{REFLO} references. The ADC interface has been optimized for low overhead/latency.

1.3 Functional Block Diagram

ADVANCE INFORMATION

A. Not all peripheral pins are available at the same time due to multiplexing.

2 Revision History

This data sheet revision history highlights the technical changes made to the SPRS698 device-specific data sheet to make it an SPRS698A revision.

- Scope:** Added 80-pin PN package and 100-pin PZ package.
Added "T" temperature range (–40°C to 105°C).
Added new sections.

Information/data on the TMS320F2806x devices is now Advance Information.

ADVANCE INFORMATION concerns new products in the sampling or preproduction phase of development. Characteristic data and other specifications are subject to change without notice.

(1) A type change represents a major functional feature difference in a peripheral module. Within a peripheral type, there may be minor differences between devices that do not affect the basic functionality of the module. These device-specific differences are listed in the *TMS320x28xx, 28xxx DSP Peripheral Reference Guide* (literature number [SPRU566](#)) and in the peripheral reference guides.

(1) "Q" refers to Q100 qualification for automotive applications.

(2) See Section 4.3, Device and Development Support Tool Nomenclature, for descriptions of device stages. The "TMX" product status denotes an experimental device that is not necessarily representative of the final device's electrical specifications.

3.2 Memory Maps

In [Figure 3-1](#) through [Figure 3-7](#), the following apply:

- Memory blocks are not to scale.
- Peripheral Frame 0, Peripheral Frame 1, Peripheral Frame 2, and Peripheral Frame 3 memory maps are restricted to data memory only. A user program cannot access these memory maps in program space.
- *Protected* means the order of Write-followed-by-Read operations is preserved rather than the pipeline order.
- Certain memory ranges are EALLOW protected against spurious writes after configuration.
- Locations 0x3D 7C80–0x3D 7CC0 contain the internal oscillator and ADC calibration routines. These locations are not programmable by the user.

ADVANCE INFORMATION

Table 3-2. Addresses of Flash Sectors in F28069/28068/28067/28066

ADDRESS RANGE	PROGRAM AND DATA SPACE
0x3D 8000 – 0x3D BFFF	Sector H (16K x 16)
0x3D C000 – 0x3D FFFF	Sector G (16K x 16)
0x3E 0000 – 0x3E 3FFF	Sector F (16K x 16)
0x3E 4000 – 0x3E 7FFF	Sector E (16K x 16)
0x3E 8000 – 0x3E BFFF	Sector D (16K x 16)
0x3E C000 – 0x3E FFFF	Sector C (16K x 16)
0x3F 0000 – 0x3F 3FFF	Sector B (16K x 16)
0x3F 4000 – 0x3F 7F7F	Sector A (16K x 16)
0x3F 7F80 – 0x3F 7FF5	Program to 0x0000 when using the Code Security Module
0x3F 7FF6 – 0x3F 7FF7	Boot-to-Flash Entry Point (program branch instruction here)
0x3F 7FF8 – 0x3F 7FFF	Security Password (128-Bit) (Do not program to all zeros)

Table 3-3. Addresses of Flash Sectors in F28065/28064/28063/28062

ADDRESS RANGE	PROGRAM AND DATA SPACE
0x3E 8000 – 0x3E 9FFF	Sector H (8K x 16)
0x3E A000 – 0x3E BFFF	Sector G (8K x 16)
0x3E C000 – 0x3E DFFF	Sector F (8K x 16)
0x3E E000 – 0x3E FFFF	Sector E (8K x 16)
0x3F 0000 – 0x3F 1FFF	Sector D (8K x 16)
0x3F 2000 – 0x3F 3FFF	Sector C (8K x 16)
0x3F 4000 – 0x3F 5FFF	Sector B (8K x 16)
0x3F 6000 – 0x3F 7F7F	Sector A (8K x 16)
0x3F 7F80 – 0x3F 7FF5	Program to 0x0000 when using the Code Security Module
0x3F 7FF6 – 0x3F 7FF7	Boot-to-Flash Entry Point (program branch instruction here)
0x3F 7FF8 – 0x3F 7FFF	Security Password (128-Bit) (Do not program to all zeros)

NOTE

- When the code-security passwords are programmed, all addresses between 0x3F 7F80 and 0x3F 7FF5 cannot be used as program code or data. These locations must be programmed to 0x0000.
- If the code security feature is not used, addresses 0x3F 7F80 through 0x3F 7FEF may be used for code or data. Addresses 0x3F 7FF0 – 0x3F 7FF5 are reserved for data and should not contain program code.

Table 3-4 shows how to handle these memory locations.

Table 3-4. Impact of Using the Code Security Module

ADDRESS	FLASH	
	CODE SECURITY ENABLED	CODE SECURITY DISABLED
0x3F 7F80 – 0x3F 7FEF	Fill with 0x0000	Application code and data
0x3F 7FF0 – 0x3F 7FF5		Reserved for data only

Peripheral Frame 1 and Peripheral Frame 2 are grouped together to enable these blocks to be write/read peripheral block protected. The protected mode makes sure that all accesses to these blocks happen as written. Because of the pipeline, a write immediately followed by a read to different memory locations, will appear in reverse order on the memory bus of the CPU. This can cause problems in certain peripheral applications where the user expected the write to occur first (as written). The CPU supports a block protection mode where a region of memory can be protected so that operations occur as written (the penalty is extra cycles are added to align the operations). This mode is programmable and by default, it protects the selected zones.

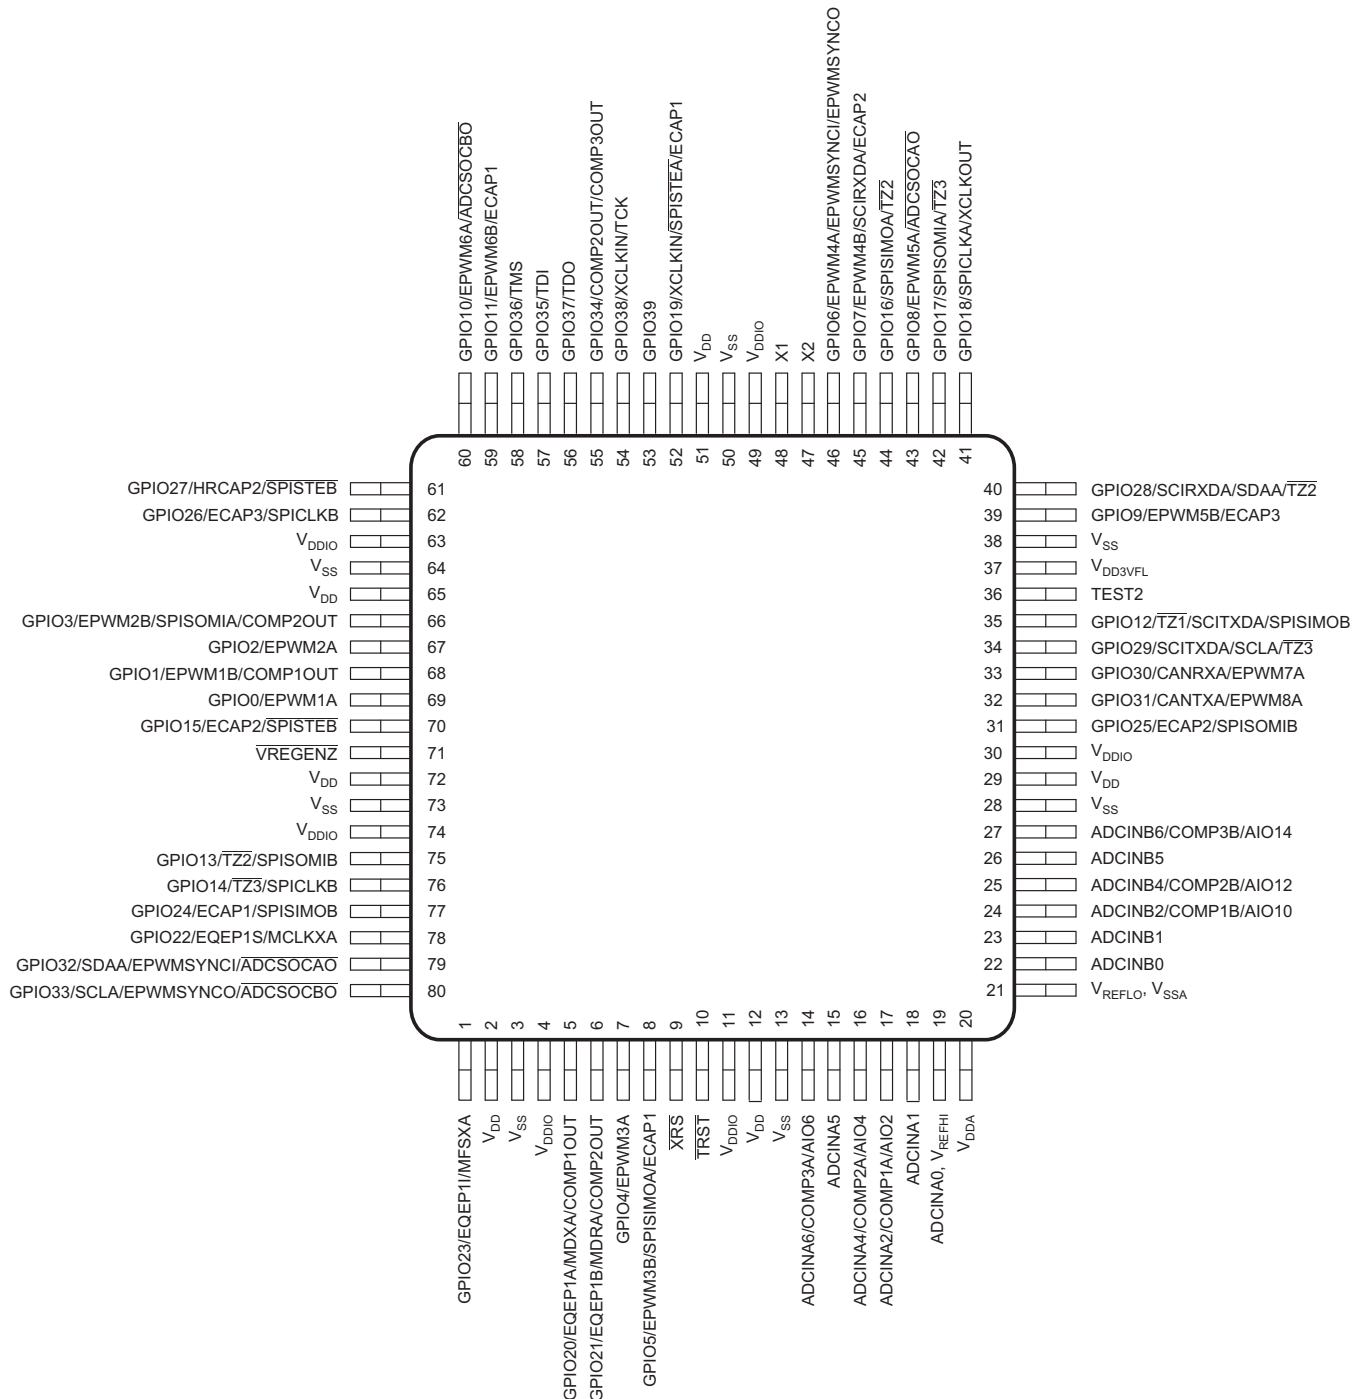

The wait-states for the various spaces in the memory map area are listed in [Table 3-5](#).

Table 3-5. Wait-States

AREA	WAIT-STATES (CPU)	COMMENTS
M0 and M1 SARAMs	0-wait	Fixed
Peripheral Frame 0	0-wait	
Peripheral Frame 1	0-wait (writes) 2-wait (reads)	Cycles can be extended by peripheral generated ready. Back-to-back write operations to Peripheral Frame 1 registers will incur a 1-cycle stall (1-cycle delay).
Peripheral Frame 2	0-wait (writes) 2-wait (reads)	Fixed. Cycles cannot be extended by the peripheral.
Peripheral Frame 3	0-wait (writes) 2-wait (reads)	Assumes no conflict between CPU and CLA/DMA cycles. The wait states can be extended by peripherals generated ready.
L0 SARAM	0-wait data and program	Assumes no CPU conflicts
L1 SARAM	0-wait data and program	Assumes no CPU conflicts
L2 SARAM	0-wait data and program	Assumes no CPU conflicts
L3 SARAM	0-wait data and program	Assumes no CPU conflicts
OTP	Programmable 1-wait minimum	Programmed via the Flash registers. 1-wait is minimum number of wait states allowed.
FLASH	Programmable 0-wait Paged min 1-wait Random min Random ≥ Paged	Programmed via the Flash registers.
FLASH Password	16-wait fixed	Wait states of password locations are fixed.
Boot-ROM	0-wait	

3.3 Pin Assignments

Figure 3-8 shows the 80-pin PN/PFP Low-Profile Quad Flatpack (LQFP) pin assignments. Figure 3-9 shows the 100-pin PZ/PZP Low-Profile Quad Flatpack (LQFP) pin assignments.

- A. Pin 19: V_{REFHI} and ADCINA0 share the same pin on the 80-pin PN/PFP device and their use is mutually exclusive to one another.
 Pin 21: V_{REFLO} is always connected to V_{SSA} on the 80-pin PN/PFP device.

Figure 3-8. 80-Pin PN/PFP LQFP (Top View)

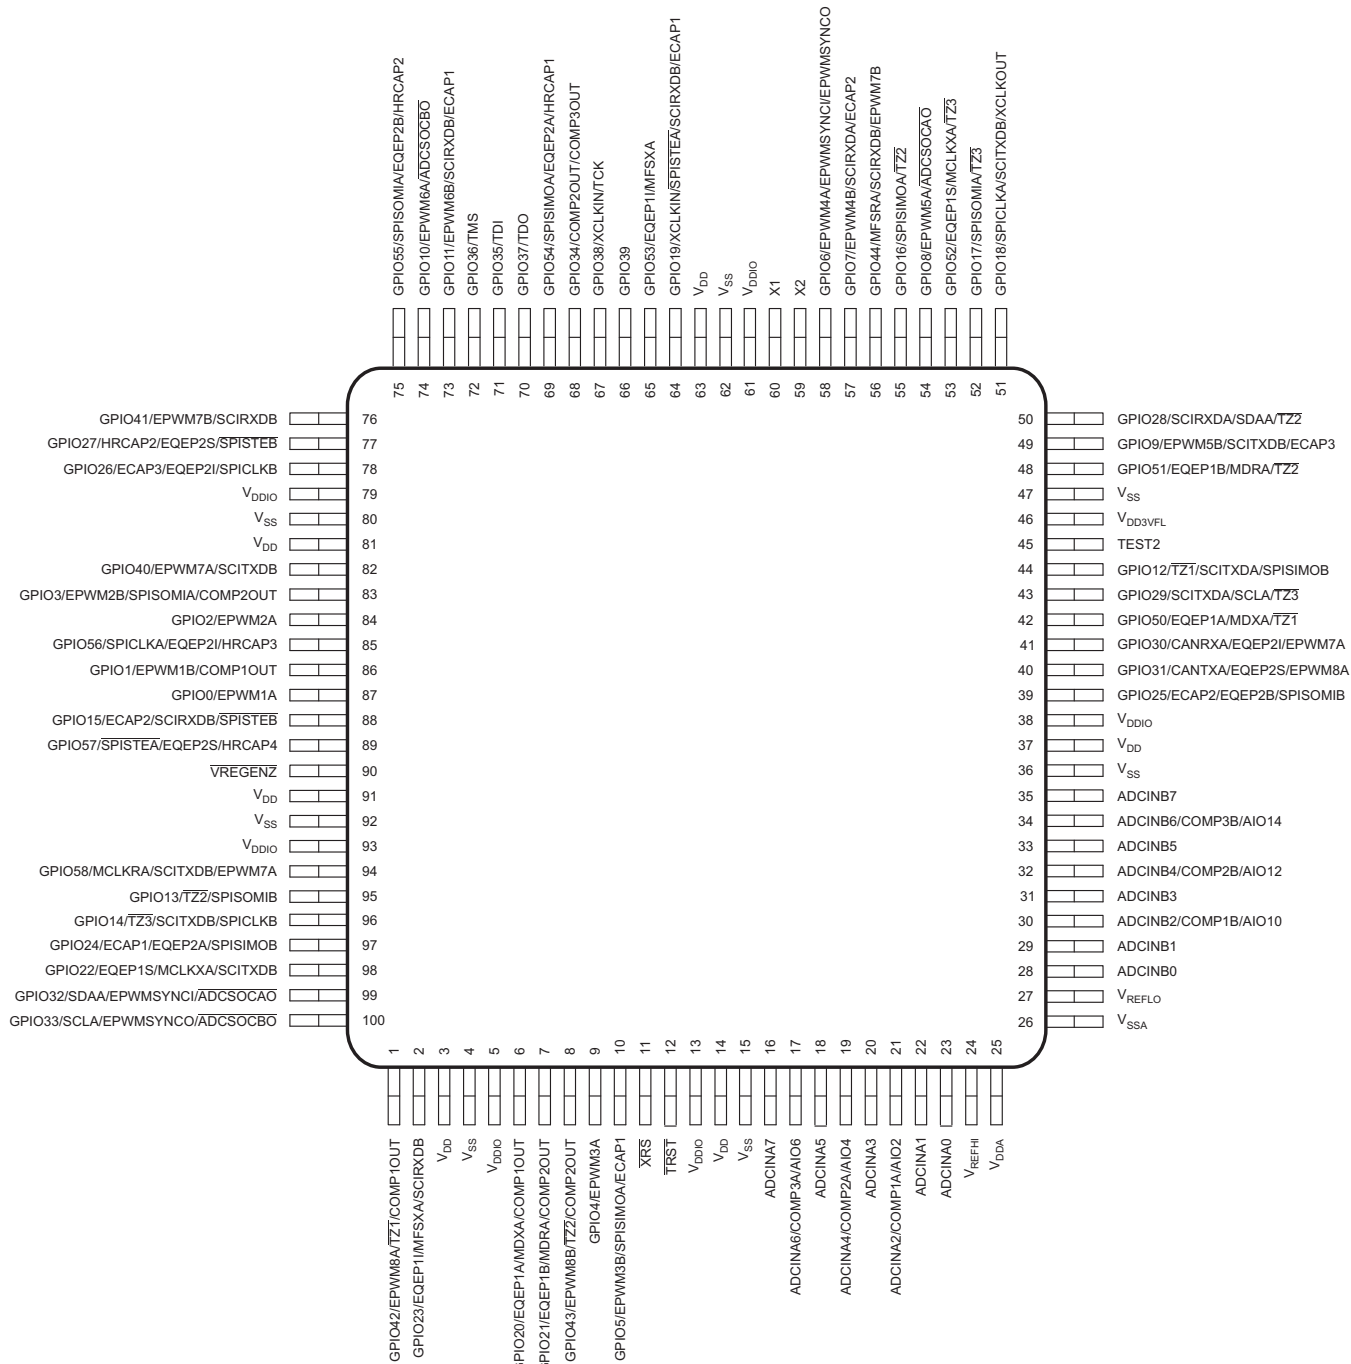

Figure 3-9. 100-Pin PZ/PZP LQFP (Top View)

ADVANCE INFORMATION

3.4 Signal Descriptions

Table 3-6 describes the signals. With the exception of the JTAG pins, the GPIO function is the default at reset, unless otherwise mentioned. The peripheral signals that are listed under them are alternate functions. Some peripheral functions may not be available in all devices. See Table 3-1 for details. Inputs are not 5-V tolerant. All GPIO pins are I/O/Z and have an internal pullup, which can be selectively enabled/disabled on a per-pin basis. This feature only applies to the GPIO pins. The pullups on the PWM pins are not enabled at reset. The pullups on other GPIO pins are enabled upon reset. The AIO pins do not have an internal pullup.

NOTE: When the on-chip VREG is used, the GPIO19, GPIO34, GPIO35, GPIO36, GPIO37, and GPIO38 pins could glitch during power up. If this is unacceptable in an application, 1.8 V could be supplied externally. There is no power-sequencing requirement when using an external 1.8-V supply. However, if the 3.3-V transistors in the level-shifting output buffers of the I/O pins are powered prior to the 1.9-V transistors, it is possible for the output buffers to turn on, causing a glitch to occur on the pin during power up. To avoid this behavior, power the V_{DD} pins prior to or simultaneously with the V_{DDIO} pins, ensuring that the V_{DD} pins have reached 0.7 V before the V_{DDIO} pins reach 0.7 V.

Table 3-6. Terminal Functions⁽¹⁾

TERMINAL			I/O/Z	DESCRIPTION
NAME	PZ/PZP PIN #	PN/PFP PIN #		
JTAG				
$\overline{\text{TRST}}$	12	10	I	JTAG test reset with internal pulldown. $\overline{\text{TRST}}$, when driven high, gives the scan system control of the operations of the device. If this signal is not connected or driven low, the device operates in its functional mode, and the test reset signals are ignored. NOTE: $\overline{\text{TRST}}$ is an active-high test pin and must be maintained low at all times during normal device operation. An external pull-down resistor is required on this pin. The value of this resistor should be based on drive strength of the debugger pods applicable to the design. A 2.2-k Ω resistor generally offers adequate protection. Since this is application-specific, it is recommended that each target board be validated for proper operation of the debugger and the application. (\downarrow)
TCK	See GPIO38		I	See GPIO38. JTAG test clock with internal pullup. (\uparrow)
TMS	See GPIO36		I	See GPIO36. JTAG test-mode select (TMS) with internal pullup. This serial control input is clocked into the TAP controller on the rising edge of TCK. (\uparrow)
TDI	See GPIO35		I	See GPIO35. JTAG test data input (TDI) with internal pullup. TDI is clocked into the selected register (instruction or data) on a rising edge of TCK. (\uparrow)
TDO	See GPIO37		O/Z	See GPIO37. JTAG scan out, test data output (TDO). The contents of the selected register (instruction or data) are shifted out of TDO on the falling edge of TCK. (8-mA drive)
FLASH				
V_{DD3VFL}	46	37		3.3-V Flash Core Power Pin. This pin should be connected to 3.3 V at all times.
TEST2	45	36	I/O	Test Pin. Reserved for TI. Must be left unconnected.

(1) I = Input, O = Output, Z = High Impedance, OD = Open Drain, \uparrow = Pullup, \downarrow = Pulldown

Table 3-6. Terminal Functions (continued)

TERMINAL			I/O/Z	DESCRIPTION
NAME	PZ/PZP PIN #	PN/PFP PIN #		
CLOCK				
XCLKOUT	See GPIO18		O/Z	See GPIO18. Output clock derived from SYSCLKOUT. XCLKOUT is either the same frequency, one-half the frequency, or one-fourth the frequency of SYSCLKOUT. This is controlled by bits 1:0 (XCLKOUTDIV) in the XCLK register. At reset, XCLKOUT = SYSCLKOUT/4. The XCLKOUT signal can be turned off by setting XCLKOUTDIV to 3. The mux control for GPIO18 must also be set to XCLKOUT for this signal to propagate to the pin.
XCLKIN	See GPIO19 and GPIO38		I	See GPIO19 and GPIO38. External oscillator input. Pin source for the clock is controlled by the XCLKINSEL bit in the XCLK register, GPIO38 is the default selection. This pin feeds a clock from an external 3.3-V oscillator. In this case, the X1 pin, if available, must be tied to GND and the on-chip crystal oscillator must be disabled via bit 14 in the CLKCTL register. If a crystal/resonator is used, the XCLKIN path must be disabled by bit 13 in the CLKCTL register. NOTE: Designs that use the GPIO38/XCLKIN/TCK pin to supply an external clock for normal device operation may need to incorporate some hooks to disable this path during debug using the JTAG connector. This is to prevent contention with the TCK signal, which is active during JTAG debug sessions. The zero-pin internal oscillators may be used during this time to clock the device.
X1	60	48	I	On-chip crystal-oscillator input. To use this oscillator, a quartz crystal or a ceramic resonator must be connected across X1 and X2. In this case, the XCLKIN path must be disabled by bit 13 in the CLKCTL register. If this pin is not used, it must be tied to GND.
X2	59	47	O	On-chip crystal-oscillator output. A quartz crystal or a ceramic resonator must be connected across X1 and X2. If X2 is not used, it must be left unconnected.
RESET				
$\overline{\text{XRS}}$	11	9	I/O	Device Reset (in) and Watchdog Reset (out). Piccolo devices have a built-in power-on-reset (POR) and brown-out-reset (BOR) circuitry. As such, no external circuitry is needed to generate a reset pulse. During a power-on or brown-out condition, this pin is driven low by the device. See Section 5.3 , Electrical Characteristics, for thresholds of the POR/BOR block. This pin is also driven low by the MCU when a watchdog reset occurs. During watchdog reset, the $\overline{\text{XRS}}$ pin is driven low for the watchdog reset duration of 512 OSCCLK cycles. If need be, an external circuitry may also drive this pin to assert a device reset. In this case, it is recommended that this pin be driven by an open-drain device. An R-C circuit must be connected to this pin for noise immunity reasons. Regardless of the source, a device reset causes the device to terminate execution. The program counter points to the address contained at the location 0x3FFFC0. When reset is deactivated, execution begins at the location designated by the program counter. The output buffer of this pin is an open-drain with an internal pullup.
ADC, COMPARATOR, ANALOG I/O				
ADCINA7	16	–	I	ADC Group A, Channel 7 input
ADCINA6	17	14	I	ADC Group A, Channel 6 input
COMP3A			I	Comparator Input 3A
AIO6			I/O	Digital AIO 6
ADCINA5	18	15	I	ADC Group A, Channel 5 input
ADCINA4	19	16	I	ADC Group A, Channel 4 input

(1) The GPIO function (shown in bold italics) is the default at reset. The peripheral signals that are listed under them are alternate functions. For JTAG pins that have the GPIO functionality multiplexed, the input path to the GPIO block is always valid. The output path from the GPIO block and the path to the JTAG block from a pin is enabled/disabled based on the condition of the TRST signal. See the "Systems Control and Interrupts" chapter of the *TMS320x2806x Piccolo Technical Reference Manual* (literature number [SPRUH18](#)).

ADVANCE INFORMATION

3.5 Brief Descriptions

3.5.1 CPU

The 2806x (C28x) family is a member of the TMS320C2000™ microcontroller (MCU) platform. The C28x-based controllers have the same 32-bit fixed-point architecture as existing C28x MCUs. It is a very efficient C/C++ engine, enabling users to develop not only their system control software in a high-level language, but also enabling development of math algorithms using C/C++. The device is as efficient at MCU math tasks as it is at system control tasks that typically are handled by microcontroller devices. This efficiency removes the need for a second processor in many systems. The 32 x 32-bit MAC 64-bit processing capabilities enable the controller to handle higher numerical resolution problems efficiently. Add to this the fast interrupt response with automatic context save of critical registers, resulting in a device that is capable of servicing many asynchronous events with minimal latency. The device has an 8-level-deep protected pipeline with pipelined memory accesses. This pipelining enables it to execute at high speeds without resorting to expensive high-speed memories. Special branch-look-ahead hardware minimizes the latency for conditional discontinuities. Special store conditional operations further improve performance.

3.5.2 Control Law Accelerator (CLA)

The C28x control law accelerator is a single-precision (32-bit) floating-point unit that extends the capabilities of the C28x CPU by adding parallel processing. The CLA is an independent processor with its own bus structure, fetch mechanism, and pipeline. Eight individual CLA tasks, or routines, can be specified. Each task is started by software or a peripheral such as the ADC, an ePWM, or CPU Timer 0. The CLA executes one task at a time to completion. When a task completes the main CPU is notified by an interrupt to the PIE and the CLA automatically begins the next highest-priority pending task. The CLA can directly access the ADC Result registers and the ePWM+HRPWM registers. Dedicated message RAMs provide a method to pass additional data between the main CPU and the CLA.

3.5.3 Viterbi, Complex Math, CRC Unit (VCU)

The C28x VCU enhances the processing power of C2000™ devices by adding additional assembly instructions to target complex math, Viterbi decode, and CRC calculations. The VCU instructions accelerate many applications, including the following:

- Orthogonal frequency-division multiplex (OFDM) used in the PRIME and G3 standards for power line communications
- Short-range radar complex math calculations
- Power calculations
- Memory and data communication packet checks (CRC)

The VCU features include:

- Instructions to support Cyclic Redundancy Checks (CRCs), which is a polynomial code checksum.
 - CRC8
 - CRC16
 - CRC32
- Instructions to support a flexible software implementation of a Viterbi decoder
 - Branch metric calculations for a code rate of 1/2 or 1/3
 - Add-Compare Select or Viterbi Butterfly in 5 cycles per butterfly
 - Traceback in 3 cycles per stage
 - Easily supports a constraint length of $K = 7$ used in PRIME and G3 standards
- Complex math arithmetic unit
 - Single-cycle Add or Subtract
 - 2-cycle multiply
 - 2-cycle multiply and accumulate (MAC)
 - Single-cycle repeat MAC
- Independent register space

3.5.4 Memory Bus (Harvard Bus Architecture)

As with many MCU-type devices, multiple busses are used to move data between the memories and peripherals and the CPU. The memory bus architecture contains a program read bus, data read bus, and data write bus. The program read bus consists of 22 address lines and 32 data lines. The data read and write busses consist of 32 address lines and 32 data lines each. The 32-bit-wide data busses enable single cycle 32-bit operations. The multiple bus architecture, commonly termed Harvard Bus, enables the C28x to fetch an instruction, read a data value and write a data value in a single cycle. All peripherals and memories attached to the memory bus prioritize memory accesses. Generally, the priority of memory bus accesses can be summarized as follows:

Highest:	Data Writes	(Simultaneous data and program writes cannot occur on the memory bus.)
	Program Writes	(Simultaneous data and program writes cannot occur on the memory bus.)
	Data Reads	
	Program Reads	(Simultaneous program reads and fetches cannot occur on the memory bus.)
Lowest:	Fetches	(Simultaneous program reads and fetches cannot occur on the memory bus.)

3.5.5 Peripheral Bus

To enable migration of peripherals between various Texas Instruments (TI) MCU family of devices, the devices adopt a peripheral bus standard for peripheral interconnect. The peripheral bus bridge multiplexes the various busses that make up the processor Memory Bus into a single bus consisting of 16 address lines and 16 or 32 data lines and associated control signals. Three versions of the peripheral bus are supported. One version supports only 16-bit accesses (called peripheral frame 2). Another version supports both 16- and 32-bit accesses (called peripheral frame 1).

3.5.6 Real-Time JTAG and Analysis

The devices implement the standard IEEE 1149.1 JTAG⁽¹⁾ interface for in-circuit based debug. Additionally, the devices support real-time mode of operation allowing modification of the contents of memory, peripheral, and register locations while the processor is running and executing code and servicing interrupts. The user can also single step through non-time-critical code while enabling time-critical interrupts to be serviced without interference. The device implements the real-time mode in hardware within the CPU. This is a feature unique to the 28x family of devices, requiring no software monitor. Additionally, special analysis hardware is provided that allows setting of hardware breakpoint or data/address watch-points and generating various user-selectable break events when a match occurs. These devices do not support boundary scan; however, IDCODE and BYPASS features are available if the following considerations are taken into account. The IDCODE does not come by default. The user needs to go through a sequence of SHIFT IR and SHIFT DR state of JTAG to get the IDCODE. For BYPASS instruction, the first shifted DR value would be 1.

3.5.7 Flash

The F28069/68/67/66 devices contain 128K x 16 of embedded flash memory, segregated into eight 16K x 16 sectors. The F28065/64/63/62 devices contain 64K x 16 of embedded flash memory, segregated into eight 8K x 16 sectors. All devices also contain a single 1K x 16 of OTP memory at address range 0x3D 7800 – 0x3D 7BFF. The user can individually erase, program, and validate a flash sector while leaving other sectors untouched. However, it is not possible to use one sector of the flash or the OTP to execute flash algorithms that erase/program other sectors. Special memory pipelining is provided to enable the flash module to achieve higher performance. The flash/OTP is mapped to both program and data space; therefore, it can be used to execute code or store data information. Addresses 0x3F 7FF0 – 0x3F 7FF5 are reserved for data variables and should not contain program code.

NOTE

The Flash and OTP wait-states can be configured by the application. This allows applications running at slower frequencies to configure the flash to use fewer wait-states.

Flash effective performance can be improved by enabling the flash pipeline mode in the Flash options register. With this mode enabled, effective performance of linear code execution will be much faster than the raw performance indicated by the wait-state configuration alone. The exact performance gain when using the Flash pipeline mode is application-dependent.

For more information on the Flash options, Flash wait-state, and OTP wait-state registers, see the "Systems Control and Interrupts" chapter of the *TMS320x2806x Piccolo Technical Reference Manual* (literature number [SPRUH18](#)).

(1) IEEE Standard 1149.1-1990 Standard Test Access Port and Boundary Scan Architecture

3.5.8 M0, M1 SARAMs

All devices contain these two blocks of single-access memory, each 1K x 16 in size. The stack pointer points to the beginning of block M1 on reset. The M0 and M1 blocks, like all other memory blocks on C28x devices, are mapped to both program and data space. Hence, the user can use M0 and M1 to execute code or for data variables. The partitioning is performed within the linker. The C28x device presents a unified memory map to the programmer. This makes for easier programming in high-level languages.

3.5.9 L4 SARAM, and L0, L1, L2, L3, L5, L6, L7, and L8 DPSARAMs

The device contains up to 48K x 16 of single-access RAM. To ascertain the exact size for a given device, see the device-specific memory map figures in [Section 3.2](#). This block is mapped to both program and data space. L0 is 2K in size. L1 and L2 are each 1K in size. L3 is 4K in size. L4, L5, L6, L7, and L8 are each 8K in size. L0, L1, and L2 are shared with the CLA, which can utilize these blocks for its data space. L3 is shared with the CLA, which can utilize this block for its program space. L5, L6, L7, and L8 are shared with the DMA, which can utilize these blocks for its data space. DPSARAM refers to the dual-port configuration of these blocks.

3.5.10 Boot ROM

The Boot ROM is factory-programmed with boot-loading software. Boot-mode signals are provided to tell the bootloader software what boot mode to use on power up. The user can select to boot normally or to download new software from an external connection or to select boot software that is programmed in the internal Flash/ROM. The Boot ROM also contains standard tables, such as SIN/COS waveforms, for use in math-related algorithms.

Table 3-7. Boot Mode Selection

MODE	GPIO37/TDO	GPIO34/COMP2OUT/ COMP3OUT	TRST	MODE
3	1	1	0	GetMode
2	1	0	0	Wait (see Section 3.5.11 for description)
1	0	1	0	SCI
0	0	0	0	Parallel IO
EMU	x	x	1	Emulation Boot

3.5.10.1 Emulation Boot

When the emulator is connected, the GPIO37/TDO pin cannot be used for boot mode selection. In this case, the boot ROM detects that an emulator is connected and uses the contents of two reserved SARAM locations in the PIE vector table to determine the boot mode. If the content of either location is invalid, then the *Wait* boot option is used. All boot mode options can be accessed in emulation boot.

3.5.10.2 GetMode

The default behavior of the *GetMode* option is to boot to flash. This behavior can be changed to another boot option by programming two locations in the OTP. If the content of either OTP location is invalid, then boot to flash is used. One of the following loaders can be specified: SCI, SPI, I2C, CAN, or OTP.

3.5.10.3 Peripheral Pins Used by the Bootloader

Table 3-8 shows which GPIO pins are used by each peripheral bootloader. Refer to the GPIO mux table to see if these conflict with any of the peripherals you would like to use in your application.

Table 3-8. Peripheral Bootload Pins

BOOTLOADER	PERIPHERAL LOADER PINS
SCI	SCIRXDA (GPIO28) SCITXDA (GPIO29)
Parallel Boot	Data (GPIO31,30,5:0) 28x Control (AIO6) Host Control (AIO12)
SPI	SPISIMOA (GPIO16) SPISOMIA (GPIO17) SPICLKA (GPIO18) SPISTEA (GPIO19)
I2C	SDAA (GPIO32) SCLA (GPIO33)
CAN	CANRXA (GPIO30) CANTXA (GPIO31)

3.5.11 Security

The devices support high levels of security to protect the user firmware from being reverse-engineered. The security features a 128-bit password (hardcoded for 16 wait-states), which the user programs into the flash. One code security module (CSM) is used to protect the flash/OTP and the L0/L1 SARAM blocks. The security feature prevents unauthorized users from examining the memory contents via the JTAG port, executing code from external memory or trying to boot-load some undesirable software that would export the secure memory contents. To enable access to the secure blocks, the user must write the correct 128-bit KEY value that matches the value stored in the password locations within the Flash.

In addition to the CSM, the emulation code security logic (ECSL) has been implemented to prevent unauthorized users from stepping through secure code. Any code or data access to flash, user OTP, or L0 memory while the emulator is connected will trip the ECSL and break the emulation connection. To allow emulation of secure code, while maintaining the CSM protection against secure memory reads, the user must write the correct value into the lower 64 bits of the KEY register, which matches the value stored in the lower 64 bits of the password locations within the flash. Note that dummy reads of all 128 bits of the password in the flash must still be performed. If the lower 64 bits of the password locations are all ones (unprogrammed), then the KEY value does not need to match.

When initially debugging a device with the password locations in flash programmed (i.e., secured), the CPU will start running and may execute an instruction that performs an access to a protected ECSL area. If this happens, the ECSL will trip and cause the emulator connection to be cut.

The solution is to use the *Wait* boot option. This will sit in a loop around a software breakpoint to allow an emulator to be connected without tripping security. Piccolo devices do not support a hardware wait-in-reset mode.

NOTE

- When the code-security passwords are programmed, all addresses between 0x3F 7F80 and 0x3F 7FF5 cannot be used as program code or data. These locations must be programmed to 0x0000.
- If the code security feature is not used, addresses 0x3F 7F80 through 0x3F 7FEF may be used for code or data. Addresses 0x3F 7FF0 – 0x3F 7FF5 are reserved for data and should not contain program code.

The 128-bit password (at 0x3F 7FF8 – 0x3F 7FFF) must not be programmed to zeros. Doing so would permanently lock the device.

Disclaimer

Code Security Module Disclaimer

THE CODE SECURITY MODULE (CSM) INCLUDED ON THIS DEVICE WAS DESIGNED TO PASSWORD PROTECT THE DATA STORED IN THE ASSOCIATED MEMORY (EITHER ROM OR FLASH) AND IS WARRANTED BY TEXAS INSTRUMENTS (TI), IN ACCORDANCE WITH ITS STANDARD TERMS AND CONDITIONS, TO CONFORM TO TI'S PUBLISHED SPECIFICATIONS FOR THE WARRANTY PERIOD APPLICABLE FOR THIS DEVICE.

TI DOES NOT, HOWEVER, WARRANT OR REPRESENT THAT THE CSM CANNOT BE COMPROMISED OR BREACHED OR THAT THE DATA STORED IN THE ASSOCIATED MEMORY CANNOT BE ACCESSED THROUGH OTHER MEANS. MOREOVER, EXCEPT AS SET FORTH ABOVE, TI MAKES NO WARRANTIES OR REPRESENTATIONS CONCERNING THE CSM OR OPERATION OF THIS DEVICE, INCLUDING ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

IN NO EVENT SHALL TI BE LIABLE FOR ANY CONSEQUENTIAL, SPECIAL, INDIRECT, INCIDENTAL, OR PUNITIVE DAMAGES, HOWEVER CAUSED, ARISING IN ANY WAY OUT OF YOUR USE OF THE CSM OR THIS DEVICE, WHETHER OR NOT TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. EXCLUDED DAMAGES INCLUDE, BUT ARE NOT LIMITED TO LOSS OF DATA, LOSS OF GOODWILL, LOSS OF USE OR INTERRUPTION OF BUSINESS OR OTHER ECONOMIC LOSS.

3.5.12 Peripheral Interrupt Expansion (PIE) Block

The PIE block serves to multiplex numerous interrupt sources into a smaller set of interrupt inputs. The PIE block can support up to 96 peripheral interrupts. On the F2806x, 72 of the possible 96 interrupts are used by peripherals. The 96 interrupts are grouped into blocks of 8 and each group is fed into 1 of 12 CPU interrupt lines (INT1 to INT12). Each of the 96 interrupts is supported by its own vector stored in a dedicated RAM block that can be overwritten by the user. The vector is automatically fetched by the CPU on servicing the interrupt. It takes 8 CPU clock cycles to fetch the vector and save critical CPU registers. Hence the CPU can quickly respond to interrupt events. Prioritization of interrupts is controlled in hardware and software. Each individual interrupt can be enabled/disabled within the PIE block.

3.5.13 External Interrupts (XINT1–XINT3)

The devices support three masked external interrupts (XINT1–XINT3). Each of the interrupts can be selected for negative, positive, or both negative and positive edge triggering and can also be enabled/disabled. These interrupts also contain a 16-bit free-running up counter, which is reset to zero when a valid interrupt edge is detected. This counter can be used to accurately time-stamp the interrupt. There are no dedicated pins for the external interrupts. XINT1, XINT2, and XINT3 interrupts can accept inputs from GPIO0–GPIO31 pins.

3.5.14 Internal Zero Pin Oscillators, Oscillator, and PLL

The device can be clocked by either of the two internal zero-pin oscillators, an external oscillator, or by a crystal attached to the on-chip oscillator circuit. A PLL is provided supporting up to 16 input-clock-scaling ratios. The PLL ratios can be changed on-the-fly in software, enabling the user to scale back on operating frequency if lower power operation is desired. Refer to [Section 5](#), Electrical Specifications, for timing details. The PLL block can be set in bypass mode. A second PLL (PLL2) feeds the HRCAP module.

3.5.15 Watchdog

Each device contains two watchdogs: CPU-Watchdog that monitors the core and NMI-Watchdog that is a missing clock-detect circuit. The user software must regularly reset the CPU-watchdog counter within a certain time frame; otherwise, the CPU-watchdog generates a reset to the processor. The CPU-watchdog can be disabled if necessary. The NMI-Watchdog engages only in case of a clock failure and can either generate an interrupt or a device reset.

3.5.16 Peripheral Clocking

The clocks to each individual peripheral can be enabled/disabled to reduce power consumption when a peripheral is not in use. Additionally, the system clock to the serial ports (except I2C) can be scaled relative to the CPU clock.

3.5.17 Low-power Modes

The devices are full static CMOS devices. Three low-power modes are provided:

- IDLE:** Places CPU in low-power mode. Peripheral clocks may be turned off selectively and only those peripherals that need to function during IDLE are left operating. An enabled interrupt from an active peripheral or the watchdog timer will wake the processor from IDLE mode.
- STANDBY:** Turns off clock to CPU and peripherals. This mode leaves the oscillator and PLL functional. An external interrupt event will wake the processor and the peripherals. Execution begins on the next valid cycle after detection of the interrupt event
- HALT:** This mode basically shuts down the device and places it in the lowest possible power-consumption mode. If the internal zero-pin oscillators are used as the clock source, the HALT mode turns them off, by default. To keep these oscillators from shutting down, the INTOSCnHALTI bits in CLKCTL register may be used. The zero-pin oscillators may thus be used to clock the CPU-watchdog in this mode. If the on-chip crystal oscillator is used as the clock source, it is shut down in this mode. A reset or an external signal (through a GPIO pin) or the CPU-watchdog can wake the device from this mode.

The CPU clock (OSCCLK) and WDCLK should be from the same clock source before attempting to put the device into HALT or STANDBY.

3.5.18 Peripheral Frames 0, 1, 2, 3 (PFn)

The device segregates peripherals into four sections. The mapping of peripherals is as follows:

PF0:	PIE:	PIE Interrupt Enable and Control Registers Plus PIE Vector Table
	Flash:	Flash Waitstate Registers
	Timers:	CPU-Timers 0, 1, 2 Registers
	CSM:	Code Security Module KEY Registers
	ADC:	ADC Result Registers
	CLA:	Control Law Accelerator Registers and Message RAMs
PF1:	GPIO:	GPIO MUX Configuration and Control Registers
	eCAN:	Enhanced Control Area Network Configuration and Control Registers
	ePWM:	Enhanced Pulse Width Modulator Module and Registers
	eCAP:	Enhanced Capture Module and Registers
	eQEP:	Enhanced Quadrature Encoder Pulse Module and Registers
	Comparators:	Comparator Modules
PF2:	SYS:	System Control Registers
	SCI:	Serial Communications Interface (SCI) Control and RX/TX Registers
	SPI:	Serial Port Interface (SPI) Control and RX/TX Registers
	ADC:	ADC Status, Control, and Configuration Registers
	I2C:	Inter-Integrated Circuit Module and Registers
	XINT:	External Interrupt Registers
PF3:	McBSP:	Multichannel Buffered Serial Port Registers

3.5.19 General-Purpose Input/Output (GPIO) Multiplexer

Most of the peripheral signals are multiplexed with general-purpose input/output (GPIO) signals. This enables the user to use a pin as GPIO if the peripheral signal or function is not used. On reset, GPIO pins are configured as inputs. The user can individually program each pin for GPIO mode or peripheral signal mode. For specific inputs, the user can also select the number of input qualification cycles. This is to filter unwanted noise glitches. The GPIO signals can also be used to bring the device out of specific low-power modes.

3.5.20 32-Bit CPU-Timers (0, 1, 2)

CPU-Timers 0, 1, and 2 are identical 32-bit timers with presetable periods and with 16-bit clock prescaling. The timers have a 32-bit count-down register, which generates an interrupt when the counter reaches zero. The counter is decremented at the CPU clock speed divided by the prescale value setting. When the counter reaches zero, it is automatically reloaded with a 32-bit period value.

CPU-Timer 0 is for general use and is connected to the PIE block. CPU-Timer 1 is also for general use and can be connected to INT13 of the CPU. CPU-Timer 2 is reserved for DSP/BIOS. It is connected to INT14 of the CPU. If DSP/BIOS is not being used, CPU-Timer 2 is available for general use.

CPU-Timer 2 can be clocked by any one of the following:

- SYSCLKOUT (default)
- Internal zero-pin oscillator 1 (INTOSC1)
- Internal zero-pin oscillator 2 (INTSOC2)
- External clock source

3.5.21 Control Peripherals

The devices support the following peripherals that are used for embedded control and communication:

- ePWM: The enhanced PWM peripheral supports independent/complementary PWM generation, adjustable dead-band generation for leading/trailing edges, latched/cycle-by-cycle trip mechanism. Some of the PWM pins support the HRPWM high resolution duty and period features. The type 1 module found on 2806x devices also supports increased dead-band resolution, enhanced SOC and interrupt generation, and advanced triggering including trip functions based on comparator outputs.
- eCAP: The enhanced capture peripheral uses a 32-bit time base and registers up to four programmable events in continuous/one-shot capture modes. This peripheral can also be configured to generate an auxiliary PWM signal.
- eQEP: The enhanced QEP peripheral uses a 32-bit position counter, supports low-speed measurement using capture unit and high-speed measurement using a 32-bit unit timer. This peripheral has a watchdog timer to detect motor stall and input error detection logic to identify simultaneous edge transition in QEP signals.
- ADC: The ADC block is a 12-bit converter. It has up to 13 single-ended channels pinned out, depending on the device. It contains two sample-and-hold units for simultaneous sampling.
- Comparator: Each comparator block consists of one analog comparator along with an internal 10-bit reference for supplying one input of the comparator.

3.5.22 Serial Port Peripherals

The devices support the following serial communication peripherals:

- SPI: The SPI is a high-speed, synchronous serial I/O port that allows a serial bit stream of programmed length (one to sixteen bits) to be shifted into and out of the device at a programmable bit-transfer rate. Normally, the SPI is used for communications between the MCU and external peripherals or another processor. Typical applications include external I/O or peripheral expansion through devices such as shift registers, display drivers, and ADCs. Multi-device communications are supported by the master/slave operation of the SPI. The SPI contains a 4-level receive and transmit FIFO for reducing interrupt servicing overhead.
- SCI: The serial communications interface is a two-wire asynchronous serial port, commonly known as UART. The SCI contains a 4-level receive and transmit FIFO for reducing interrupt servicing overhead.
- I2C: The inter-integrated circuit (I2C) module provides an interface between a MCU and other devices compliant with Philips Semiconductors Inter-IC bus (I2C-bus) specification version 2.1 and connected by way of an I2C-bus. External components attached to this 2-wire serial bus can transmit/receive up to 8-bit data to/from the MCU through the I2C module. The I2C contains a 4-level receive-and-transmit FIFO for reducing interrupt servicing overhead.
- eCAN: This is the enhanced version of the CAN peripheral. It supports 32 mailboxes, time stamping of messages, and is CAN 2.0B-compliant.
- McBSP: The multichannel buffered serial port (McBSP) connects to E1/T1 lines, phone-quality codecs for modem applications or high-quality stereo audio DAC devices. The McBSP receive and transmit registers are supported by the DMA to significantly reduce the overhead for servicing this peripheral. Each McBSP module can be configured as an SPI as required.

3.6 Register Map

The devices contain four peripheral register spaces. The spaces are categorized as follows:

Peripheral Frame 0: These are peripherals that are mapped directly to the CPU memory bus. See [Table 3-9](#).

Peripheral Frame 1: These are peripherals that are mapped to the 32-bit peripheral bus. See [Table 3-10](#).

Peripheral Frame 2: These are peripherals that are mapped to the 16-bit peripheral bus. See [Table 3-11](#).

Peripheral Frame 3: McBSP registers are mapped to this. See [Table 3-12](#).

Table 3-9. Peripheral Frame 0 Registers⁽¹⁾

NAME	ADDRESS RANGE	SIZE (x16)	EALLOW PROTECTED ⁽²⁾
Device Emulation Registers	0x00 0880 – 0x00 0984	261	Yes
System Power Control Registers	0x00 0985 – 0x00 0987	3	Yes
FLASH Registers ⁽³⁾	0x00 0A80 – 0x00 0ADF	96	Yes
Code Security Module Registers	0x00 0AE0 – 0x00 0AEF	16	Yes
ADC registers (0 wait read only)	0x00 0B00 – 0x00 0B0F	16	No
CPU–TIMER0/1/2 Registers	0x00 0C00 – 0x00 0C3F	64	No
PIE Registers	0x00 0CE0 – 0x00 0CFF	32	No
PIE Vector Table	0x00 0D00 – 0x00 0DFF	256	No
DMA Registers	0x00 1000 – 0x00 11FF	512	Yes
CLA Registers	0x00 1400 – 0x00 147F	128	Yes
CLA to CPU Message RAM (CPU writes ignored)	0x00 1480 – 0x00 14FF	128	NA
CPU to CLA Message RAM (CLA writes ignored)	0x00 1500 – 0x00 157F	128	NA

- (1) Registers in Frame 0 support 16-bit and 32-bit accesses.
- (2) If registers are EALLOW protected, then writes cannot be performed until the EALLOW instruction is executed. The EDIS instruction disables writes to prevent stray code or pointers from corrupting register contents.
- (3) The Flash Registers are also protected by the Code Security Module (CSM).

Table 3-10. Peripheral Frame 1 Registers

NAME	ADDRESS RANGE	SIZE (x16)	EALLOW PROTECTED
eCAN-A registers	0x00 6000 – 0x00 61FF	512	(1)

ADVANCE INFORMATION

3.8 VREG/BOR/POR

Although the core and I/O circuitry operate on two different voltages, these devices have an on-chip voltage regulator (VREG) to generate the V_{DD} voltage from the V_{DDIO} supply. This eliminates the cost and space of a second external regulator on an application board. Additionally, internal power-on reset (POR) and brown-out reset (BOR) circuits monitor both the V_{DD} and V_{DDIO} rails during power-up and run mode.

3.8.1 On-chip Voltage Regulator (VREG)

A linear regulator generates the core voltage (V_{DD}) from the V_{DDIO} supply. Therefore, although capacitors are required on each V_{DD} pin to stabilize the generated voltage, power need not be supplied to these pins to operate the device. Conversely, the VREG can be disabled, should power or redundancy be the primary concern of the application.

3.8.1.1 Using the On-chip VREG

To utilize the on-chip VREG, the $\overline{\text{VREGENZ}}$ pin should be tied low and the appropriate recommended operating voltage should be supplied to the V_{DDIO} and V_{DDA} pins. In this case, the V_{DD} voltage needed by the core logic will be generated by the VREG. Each V_{DD} pin requires on the order of 1.2 μF (minimum) capacitance for proper regulation of the VREG. These capacitors should be located as close as possible to the V_{DD} pins.

3.8.1.2 Disabling the On-chip VREG

To conserve power, it is also possible to disable the on-chip VREG and supply the core logic voltage to the V_{DD} pins with a more efficient external regulator. To enable this option, the $\overline{\text{VREGENZ}}$ pin must be tied high.

3.8.2 On-chip Power-On Reset (POR) and Brown-Out Reset (BOR) Circuit

Two on-chip supervisory circuits, the power-on reset (POR) and the brown-out reset (BOR) remove the burden of monitoring the V_{DD} and V_{DDIO} supply rails from the application board. The purpose of the POR is to create a clean reset throughout the device during the entire power-up procedure. The trip point is a looser, lower trip point than the BOR, which watches for dips in the V_{DD} or V_{DDIO} rail during device operation. The POR function is present on both V_{DD} and V_{DDIO} rails at all times. After initial device power-up, the BOR function is present on V_{DDIO} at all times, and on V_{DD} when the internal VREG is enabled ($\overline{\text{VREGENZ}}$ pin is tied low). Both functions tie the $\overline{\text{XRS}}$ pin low when one of the voltages is below their respective trip point. Additionally, when the internal voltage regulator is enabled, an over-voltage protection circuit will tie $\overline{\text{XRS}}$ low if the V_{DD} rail rises above its trip point. See [Section 5](#) for the various trip points as well as the delay time for the device to release the $\overline{\text{XRS}}$ pin after the under/over-voltage condition is removed. [Figure 3-10](#) shows the VREG, POR, and BOR. To disable both the V_{DD} and V_{DDIO} BOR functions, a bit is provided in the BORCFG register. See the "Systems Control and Interrupts" chapter of the *TMS320x2806x Piccolo Technical Reference Manual* (literature number [SPRUH18](#)) for details.

- A. \overline{WDRST} is the reset signal from the CPU-watchdog.
- B. \overline{PBRs} is the reset signal from the POR/BOR module.

Figure 3-10. VREG + POR + BOR + Reset Signal Connectivity

ADVANCE INFORMATION

3.9 System Control

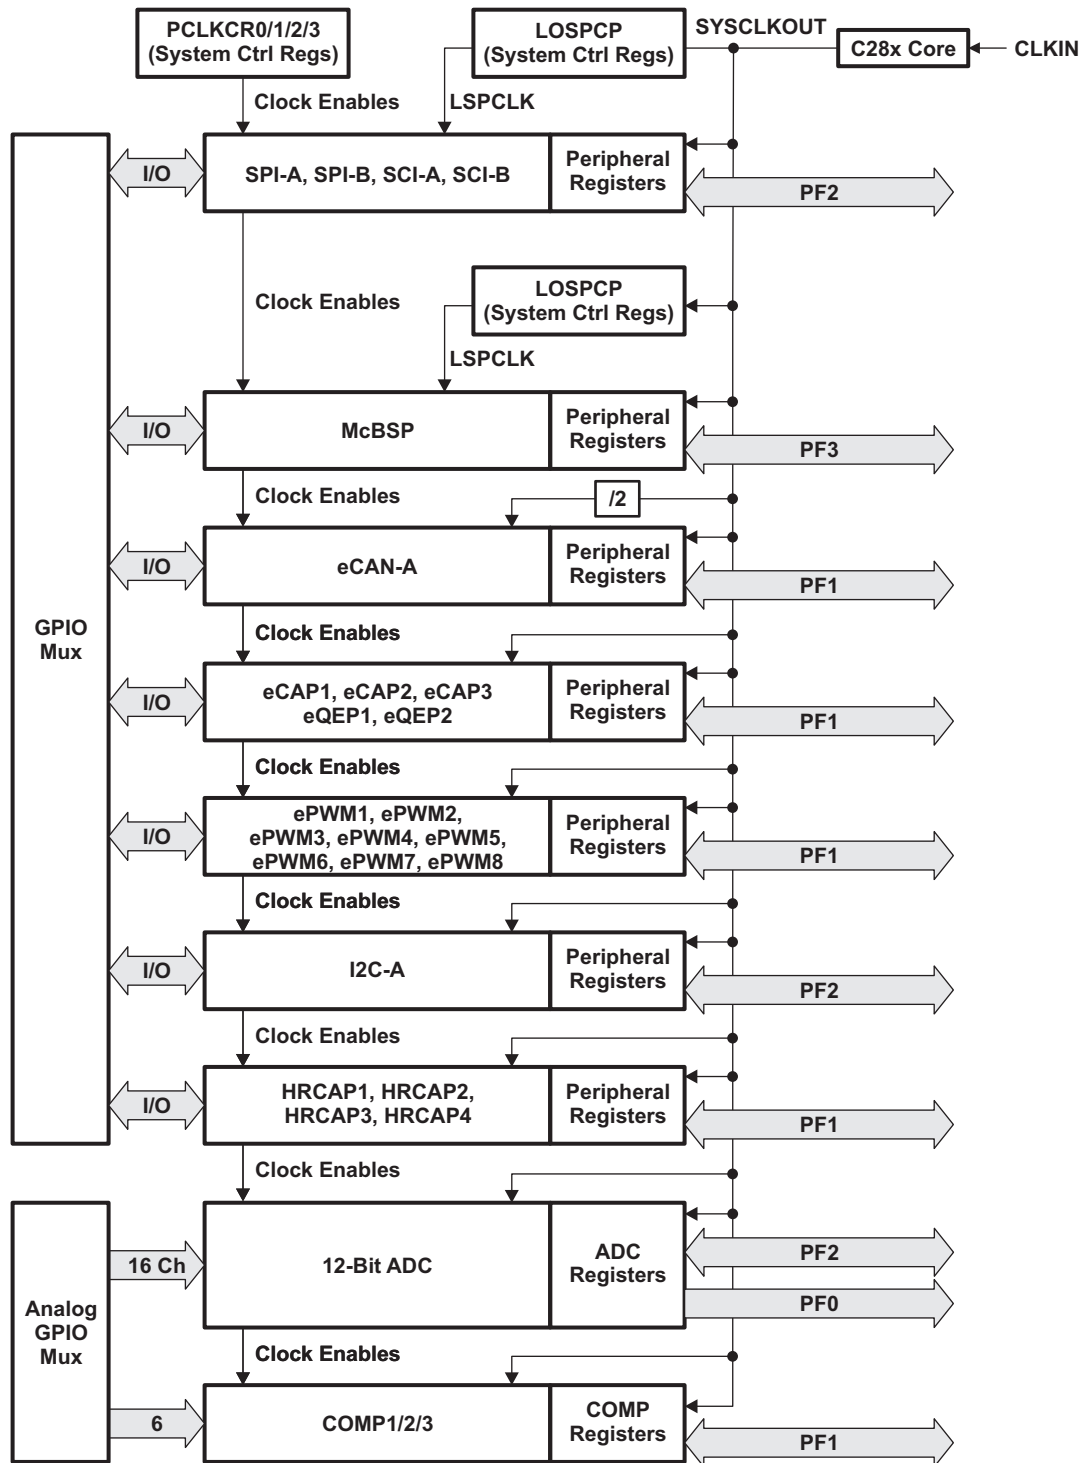

This section describes the oscillator and clocking mechanisms, the watchdog function and the low power modes.

Table 3-14. PLL, Clocking, Watchdog, and Low-Power Mode Registers

(1) All registers in this table are EALLOW protected.

Figure 3-11 shows the various clock domains that are discussed. Figure 3-12 shows the various clock sources (both internal and external) that can provide a clock for device operation.

A. CLKIN is the clock into the CPU. It is passed out of the CPU as SYSCLKOUT (that is, CLKIN is the same frequency as SYSCLKOUT).

Figure 3-11. Clock and Reset Domains

- A. Register loaded from TI OTP-based calibration function.
- B. See Section 3.9.4 for details on missing clock detection.

Figure 3-12. Clock Tree

ADVANCE INFORMATION

3.9.1 Internal Zero Pin Oscillators

The F2806x devices contain two independent internal zero pin oscillators. By default both oscillators are turned on at power up, and internal oscillator 1 is the default clock source at this time. For power savings, unused oscillators may be powered down by the user. The center frequency of these oscillators is determined by their respective oscillator trim registers, written to in the calibration routine as part of the boot ROM execution. See [Section 6](#), Peripheral and Electrical Specifications, for more information on these oscillators.

3.9.2 Crystal Oscillator Option

The typical specifications for the external quartz crystal (fundamental mode, parallel resonant) are listed in [Table 3-15](#). Furthermore, ESR range = 30 to 150 Ω .

Table 3-15. Typical Specifications for External Quartz Crystal⁽¹⁾

FREQUENCY (MHz)	R _d (Ω)	C _{L1} (pF)	C _{L2} (pF)
5	2200	18	18
10	470	15	15
15	0	15	15
20	0	12	12

(1) C_{shunt} should be less than or equal to 5 pF.

Figure 3-13. Using the On-chip Crystal Oscillator

NOTE

1. C_{L1} and C_{L2} are the total capacitance of the circuit board and components excluding the IC and crystal. The value is usually approximately twice the value of the crystal's load capacitance.
2. The load capacitance of the crystal is described in the crystal specifications of the manufacturers.
3. TI recommends that customers have the resonator/crystal vendor characterize the operation of their device with the MCU chip. The resonator/crystal vendor has the equipment and expertise to tune the tank circuit. The vendor can also advise the customer regarding the proper tank component values that will produce proper start up and stability over the entire operating range.

Figure 3-14. Using a 3.3-V External Oscillator

3.9.3 PLL-Based Clock Module

The devices have an on-chip, PLL-based clock module. This module provides all the necessary clocking signals for the device, as well as control for low-power mode entry. The PLL has a 5-bit ratio control PLLCR[DIV] to select different CPU clock rates. The watchdog module should be disabled before writing to the PLLCR register. It can be re-enabled (if need be) after the PLL module has stabilized, which takes 1 ms. The input clock and PLLCR[DIV] bits should be chosen in such a way that the output frequency of the PLL (VCOCLK) is at least 50 MHz.

Table 3-16. PLL Settings

PLLCR[DIV] VALUE ⁽¹⁾ ⁽²⁾	SYSCLKOUT (CLKIN)		
	PLLSTS[DIVSEL] = 0 or 1 ⁽³⁾	PLLSTS[DIVSEL] = 2	PLLSTS[DIVSEL] = 3
00000 (PLL bypass)	OSCCLK/4 (Default) ⁽¹⁾	OSCCLK/2	OSCCLK
00001	(OSCCLK * 1)/4	(OSCCLK * 1)/2	(OSCCLK * 1)/1
00010	(OSCCLK * 2)/4	(OSCCLK * 2)/2	(OSCCLK * 2)/1
00011	(OSCCLK * 3)/4	(OSCCLK * 3)/2	(OSCCLK * 3)/1
00100	(OSCCLK * 4)/4	(OSCCLK * 4)/2	(OSCCLK * 4)/1
00101	(OSCCLK * 5)/4	(OSCCLK * 5)/2	(OSCCLK * 5)/1
00110	(OSCCLK * 6)/4	(OSCCLK * 6)/2	(OSCCLK * 6)/1
00111	(OSCCLK * 7)/4	(OSCCLK * 7)/2	(OSCCLK * 7)/1
01000	(OSCCLK * 8)/4	(OSCCLK * 8)/2	(OSCCLK * 8)/1
01001	(OSCCLK * 9)/4	(OSCCLK * 9)/2	(OSCCLK * 9)/1
01010	(OSCCLK * 10)/4	(OSCCLK * 10)/2	(OSCCLK * 10)/1
01011	(OSCCLK * 11)/4	(OSCCLK * 11)/2	(OSCCLK * 11)/1
01100	(OSCCLK * 12)/4	(OSCCLK * 12)/2	(OSCCLK * 12)/1
01101	(OSCCLK * 13)/4	(OSCCLK * 13)/2	(OSCCLK * 13)/1
01110	(OSCCLK * 14)/4	(OSCCLK * 14)/2	(OSCCLK * 14)/1
01111	(OSCCLK * 15)/4	(OSCCLK * 15)/2	(OSCCLK * 15)/1
10000	(OSCCLK * 16)/4	(OSCCLK * 16)/2	(OSCCLK * 16)/1

- (1) The PLL control register (PLLCR) and PLL Status Register (PLLSTS) are reset to their default state by the \overline{XRS} signal or a watchdog reset only. A reset issued by the debugger or the missing clock detect logic has no effect.
- (2) This register is EALLOW protected. See the "Systems Control and Interrupts" chapter of the *TMS320x2806x Piccolo Technical Reference Manual* (literature number [SPRUH18](#)) for more information.
- (3) By default, PLLSTS[DIVSEL] is configured for /4. (The boot ROM changes this to /1.) PLLSTS[DIVSEL] must be 0 before writing to the PLLCR and should be changed only after PLLSTS[PLLLOCKS] = 1.

Table 3-17. CLKIN Divide Options

PLLSTS [DIVSEL]	CLKIN DIVIDE
0	/4
1	/4
2	/2
3	/1

The PLL-based clock module provides four modes of operation:

- **INTOSC1 (Internal Zero-pin Oscillator 1):** This is the on-chip internal oscillator 1. This can provide the clock for the Watchdog block, core and CPU-Timer 2
- **INTOSC2 (Internal Zero-pin Oscillator 2):** This is the on-chip internal oscillator 2. This can provide the clock for the Watchdog block, core and CPU-Timer 2. Both INTOSC1 and INTOSC2 can be independently chosen for the Watchdog block, core and CPU-Timer 2.
- **Crystal/Resonator Operation:** The on-chip (crystal) oscillator enables the use of an external crystal/resonator attached to the device to provide the time base. The crystal/resonator is connected to the X1/X2 pins. Some devices may not have the X1/X2 pins. See [Table 3-6](#) for details.
- **External Clock Source Operation:** If the on-chip (crystal) oscillator is not used, this mode allows it to be bypassed. The device clocks are generated from an external clock source input on the XCLKIN pin. Note that the XCLKIN is multiplexed with GPIO19 or GPIO38 pin. The XCLKIN input can be selected as GPIO19 or GPIO38 via the XCLKINSEL bit in XCLK register. The CLKCTL[XCLKINOFF] bit disables this clock input (forced low). If the clock source is not used or the respective pins are used as GPIOs, the user should disable at boot time.

Before changing clock sources, ensure that the target clock is present. If a clock is not present, then that clock source must be disabled (using the CLKCTL register) before switching clocks.

Table 3-18. Possible PLL Configuration Modes

PLL MODE	REMARKS	PLLSTS[DIVSEL]	CLKIN AND SYSCLOCKOUT
PLL Off	Invoked by the user setting the PLOFF bit in the PLLSTS register. The PLL block is disabled in this mode. This can be useful to reduce system noise and for low power operation. The PLLCR register must first be set to 0x0000 (PLL Bypass) before entering this mode. The CPU clock (CLKIN) is derived directly from the input clock on either X1/X2, X1 or XCLKIN.	0, 1 2 3	OSCCLK/4 OSCCLK/2 OSCCLK/1
PLL Bypass	PLL Bypass is the default PLL configuration upon power-up or after an external reset (XRS). This mode is selected when the PLLCR register is set to 0x0000 or while the PLL locks to a new frequency after the PLLCR register has been modified. In this mode, the PLL itself is bypassed but the PLL is not turned off.	0, 1 2 3	OSCCLK/4 OSCCLK/2 OSCCLK/1
PLL Enable ⁽¹⁾	Achieved by writing a non-zero value n into the PLLCR register. Upon writing to the PLLCR the device will switch to PLL Bypass mode until the PLL locks.	0, 1 2 3	OSCCLK * n/4 OSCCLK * n/2 OSCCLK * n/1

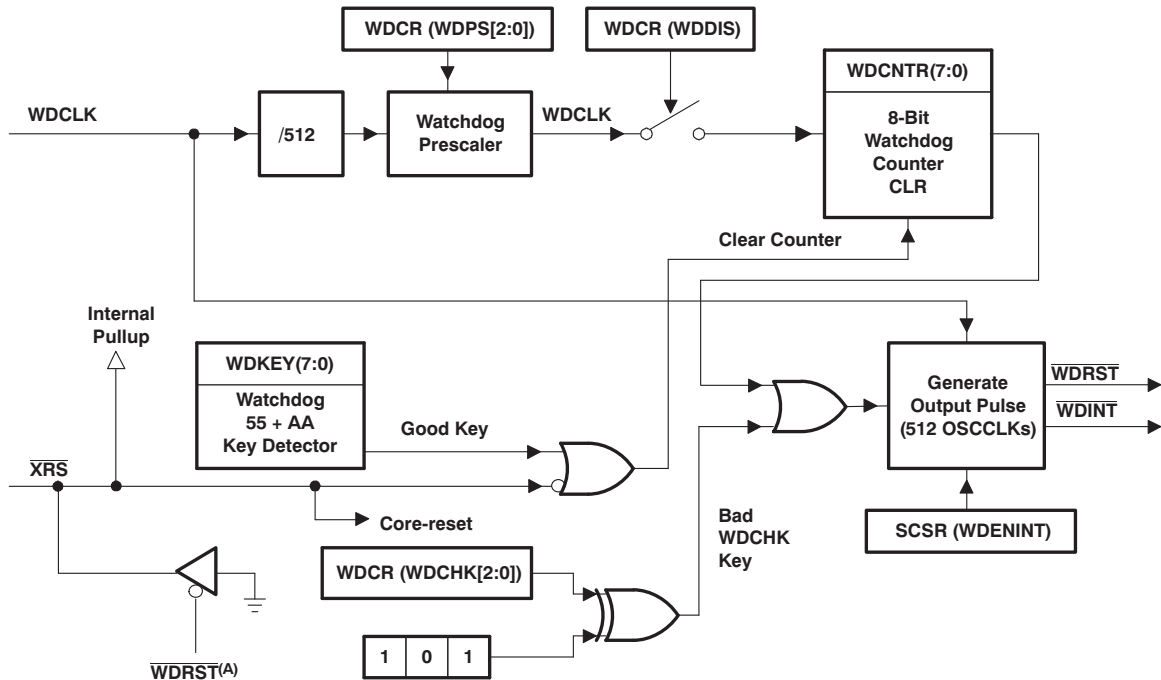

(1) PLLSTS[DIVSEL] should not be set to /1 mode while the PLL is enabled.

3.9.4 Loss of Input Clock (NMI Watchdog Function)

The 2806x devices may be clocked from either one of the internal zero-pin oscillators (INTOSC1/INTOSC2), the on-chip crystal oscillator, or from an external clock input. Regardless of the clock source, in PLL-enabled and PLL-bypass mode, if the input clock to the PLL vanishes, the PLL will issue a limp-mode clock at its output. This limp-mode clock continues to clock the CPU and peripherals at a typical frequency of 1–5 MHz.

When the limp mode is activated, a $\overline{\text{CLOCKFAIL}}$ signal is generated that is latched as an NMI interrupt. Depending on how the NMIRESETSEL bit has been configured, a reset to the device can be fired immediately or the NMI watchdog counter can issue a reset when it overflows. In addition to this, the Missing Clock Status (MCLKSTS) bit is set. The NMI interrupt could be used by the application to detect the input clock failure and initiate necessary corrective action such as switching over to an alternative clock source (if available) or initiate a shut-down procedure for the system.

If the software does not respond to the clock-fail condition, the NMI watchdog triggers a reset after a preprogrammed time interval. [Figure 3-15](#) shows the interrupt mechanisms involved.

A. The $\overline{\text{WDRST}}$ signal is driven low for 512 OSCCLK cycles.

Figure 3-16. CPU-Watchdog Module

The $\overline{\text{WDINT}}$ signal enables the watchdog to be used as a wakeup from IDLE/STANDBY mode.

In STANDBY mode, all peripherals are turned off on the device. The only peripheral that remains functional is the CPU-watchdog. This module will run off OSCCLK. The $\overline{\text{WDINT}}$ signal is fed to the LPM block so that it can wake the device from STANDBY (if enabled). See Section 3.10, Low-power Modes Block, for more details.

In IDLE mode, the $\overline{\text{WDINT}}$ signal can generate an interrupt to the CPU, via the PIE, to take the CPU out of IDLE mode.

In HALT mode, the CPU-watchdog can be used to wake up the device through a device reset.

3.10 Low-power Modes Block

Table 3-19 summarizes the various modes.

Table 3-19. Low-power Modes

MODE	LPMCR0(1:0)	OSCCLK	CLKIN	SYSCLKOUT	EXIT ⁽¹⁾
IDLE	00	On	On	On	\overline{XRS} , CPU-watchdog interrupt, any enabled interrupt
STANDBY	01	On (CPU-watchdog still running)	Off	Off	\overline{XRS} , CPU-watchdog interrupt, GPIO Port A signal, debugger ⁽²⁾
HALT ⁽³⁾	1X	Off (on-chip crystal oscillator and PLL turned off, zero-pin oscillator and CPU-watchdog state dependent on user code.)	Off	Off	\overline{XRS} , GPIO Port A signal, debugger ⁽²⁾ , CPU-watchdog

- (1) The Exit column lists which signals or under what conditions the low power mode is exited. A low signal, on any of the signals, exits the low power condition. This signal must be kept low long enough for an interrupt to be recognized by the device. Otherwise, the low-power mode will not be exited and the device will go back into the indicated low power mode.
- (2) The JTAG port can still function even if the CPU clock (CLKIN) is turned off.
- (3) The WDCLK must be active for the device to go into HALT mode.

The various low-power modes operate as follows:

- IDLE Mode:** This mode is exited by any enabled interrupt that is recognized by the processor. The LPM block performs no tasks during this mode as long as the LPMCR0(LPM) bits are set to 0,0.
- STANDBY Mode:** Any GPIO port A signal (GPIO[31:0]) can wake the device from STANDBY mode. The user must select which signal(s) will wake the device in the GPIOLPMSEL register. The selected signal(s) are also qualified by the OSCCLK before waking the device. The number of OSCCLKs is specified in the LPMCR0 register.
- HALT Mode:** CPU-watchdog, \overline{XRS} , and any GPIO port A signal (GPIO[31:0]) can wake the device from HALT mode. The user selects the signal in the GPIOLPMSEL register.

NOTE

The low-power modes do not affect the state of the output pins (PWM pins included). They will be in whatever state the code left them in when the IDLE instruction was executed. See the "Systems Control and Interrupts" chapter of the *TMS320x2806x Piccolo Technical Reference Manual* (literature number [SPRUH18](#)) for more details.

4 Device and Documentation Support

4.1 Getting Started

This section gives a brief overview of the steps to take when first developing for a C28x device. For more detail on each of these steps, see the following:

- *Getting Started With TMS320C28x Digital Signal Controllers* (literature number [SPRAAM0](#)).
- [C2000 Getting Started Website \(http://www.ti.com/c2000getstarted\)](http://www.ti.com/c2000getstarted)
- TMS320F28x MCU Development and Experimenter's Kits (<http://www.ti.com/f28xkits>)

4.2 Development Support

Texas Instruments (TI) offers an extensive line of development tools for the C28x™ generation of MCUs, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules.

The following products support development of 2806x-based applications:

Software Development Tools

- Code Composer Studio™ Integrated Development Environment (IDE)
 - C/C++ Compiler
 - Code generation tools
 - Assembler/Linker
 - Cycle Accurate Simulator
- Application algorithms
- Sample applications code

Hardware Development Tools

- Development and evaluation boards
- JTAG-based emulators - XDS510™ class, XDS560™ emulator, XDS100
- Flash programming tools
- Power supply
- Documentation and cables

4.3 Device and Development Support Tool Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all TMS320™ MCU devices and support tools. Each TMS320™ MCU commercial family member has one of three prefixes: TMX, TMP, or TMS (e.g., **TMX**320F28069). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

- | | |
|------------|--|
| TMX | Experimental device that is not necessarily representative of the final device's electrical specifications |
| TMP | Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification |
| TMS | Fully qualified production device |

Support tool development evolutionary flow:

- TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing
- TMDS** Fully qualified development-support product

TMX and TMP devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, PZP) and temperature range (for example, S). [Figure 4-1](#) provides a legend for reading the complete device name for any family member.

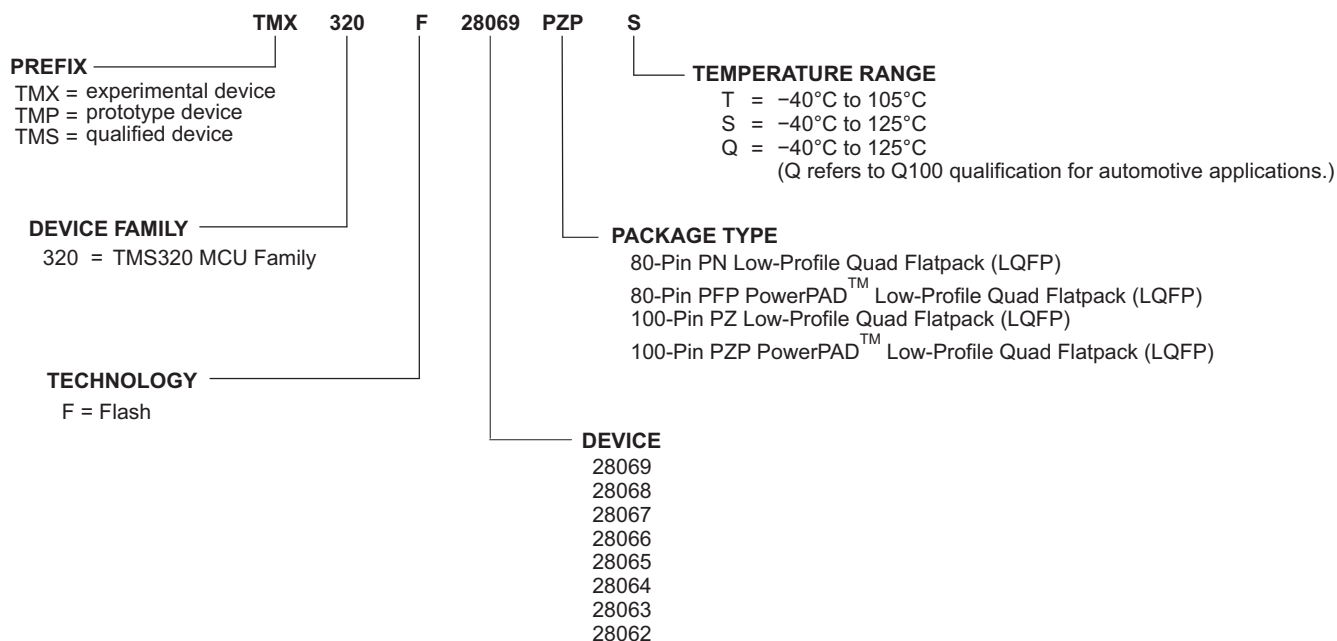

Figure 4-1. Device Nomenclature

4.4 Documentation Support

Extensive documentation supports all of the TMS320™ MCU family generations of devices from product announcement through applications development. The types of documentation available include: data sheets and data manuals, with design specifications; and hardware and software applications.

See the *TMS320x28xx, 28xxx DSP Peripheral Reference Guide* (literature number [SPRU566](#)) for more information on types of peripherals. See the *TMS320x2806x Piccolo Technical Reference Manual* (literature number [SPRUH18](#)) for more information about each peripheral.

The following documents can be downloaded from the TI website (www.ti.com):

Data Manual/Errata

[SPRS698](#) **TMS320F28069, TMS320F28068, TMS320F28067, TMS320F28066, TMS320F28065, TMS320F28064, TMS320F28063, TMS320F28062 Piccolo Microcontrollers Data Manual** contains the pinout, signal descriptions, as well as electrical and timing specifications for the 2806x devices.

[SPRZ342](#) **TMS320F28069, TMS320F28068, TMS320F28067, TMS320F28066, TMS320F28065, TMS320F28064, TMS320F28063, TMS320F28062 Piccolo MCU Silicon Errata** describes known advisories on silicon and provides workarounds.

CPU User's Guides

[SPRU430](#) **TMS320C28x CPU and Instruction Set Reference Guide** describes the central processing unit (CPU) and the assembly language instructions of the TMS320C28x fixed-point digital signal processors (DSPs). It also describes emulation features available on these DSPs.

Peripheral Guides and Technical Reference Manuals

[SPRU566](#) **TMS320x28xx, 28xxx DSP Peripheral Reference Guide** describes the peripheral reference guides of the 28x digital signal processors (DSPs).

[SPRUH18](#) **TMS320x2806x Piccolo Technical Reference Manual** details the integration, the environment, the functional description, and the programming models for each peripheral and subsystem in the device.

Tools Guides

[SPRU513](#) **TMS320C28x Assembly Language Tools v5.0.0 User's Guide** describes the assembly language tools (assembler and other tools used to develop assembly language code), assembler directives, macros, common object file format, and symbolic debugging directives for the TMS320C28x device.

[SPRU514](#) **TMS320C28x Optimizing C/C++ Compiler v5.0.0 User's Guide** describes the TMS320C28x™ C/C++ compiler. This compiler accepts ANSI standard C/C++ source code and produces TMS320 DSP assembly language source code for the TMS320C28x device.

[SPRU608](#) **TMS320C28x Instruction Set Simulator Technical Overview** describes the simulator, available within the Code Composer Studio for TMS320C2000 IDE, that simulates the instruction set of the C28x™ core.

4.5 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

[TI E2E Community](#) *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

[TI Embedded Processors Wiki](#) *Texas Instruments Embedded Processors Wiki*. Established to help developers get started with Embedded Processors from Texas Instruments and to foster innovation and growth of general knowledge about the hardware and software surrounding these devices.

5 Device Operating Conditions

5.1 Absolute Maximum Ratings^{(1) (2)}

Supply voltage range, V_{DDIO} (I/O and Flash)	with respect to V_{SS}	–0.3 V to 4.6 V
Supply voltage range, V_{DD}	with respect to V_{SS}	–0.3 V to 2.5 V
Analog voltage range, V_{DDA}	with respect to V_{SSA}	–0.3 V to 4.6 V
Input voltage range, V_{IN} (3.3 V)		–0.3 V to 4.6 V
Output voltage range, V_O		–0.3 V to 4.6 V
Input clamp current, I_{IK} ($V_{IN} < 0$ or $V_{IN} > V_{DDIO}$) ⁽³⁾		±20 mA
Output clamp current, I_{OK} ($V_O < 0$ or $V_O > V_{DDIO}$)		±20 mA
Junction temperature range, T_J ⁽⁴⁾		–40°C to 150°C
Storage temperature range, T_{stg} ⁽⁴⁾		–65°C to 150°C

- (1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under [Section 5.2](#) is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to V_{SS} , unless otherwise noted.
- (3) Continuous clamp current per pin is ± 2 mA.
- (4) Long-term high-temperature storage and/or extended use at maximum temperature conditions may result in a reduction of overall device life. For additional information, see *IC Package Thermal Metrics Application Report* (literature number [SPRA953](#)) and *Reliability Data for TMS320LF24xx and TMS320F28xx Devices Application Report* (literature number [SPRA963](#)).

5.2 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
Device supply voltage, I/O, V_{DDIO} ⁽¹⁾		2.97	3.3	3.63	V
Device supply voltage CPU, V_{DD} (When internal VREG is disabled and 1.8 V is supplied externally)		1.71	1.8	1.995	V
Supply ground, V_{SS}			0		V
Analog supply voltage, V_{DDA} ⁽¹⁾		2.97	3.3	3.63	V
Analog ground, V_{SSA}			0		V
Device clock frequency (system clock)		2		80	MHz
High-level input voltage, V_{IH} (3.3 V)		2		$V_{DDIO} + 0.3$	V
Low-level input voltage, V_{IL} (3.3 V)		$V_{SS} - 0.3$		0.8	V
High-level output source current, $V_{OH} = V_{OH(MIN)}$, I_{OH}	All GPIO/AIO pins		–4		mA
	Group 2 ⁽²⁾		–8		mA
Low-level output sink current, $V_{OL} = V_{OL(MAX)}$, I_{OL}	All GPIO/AIO pins		4		mA
	Group 2 ⁽²⁾		8		mA
Junction temperature, T_J ⁽³⁾	T version	–40		105	°C
	S version	–40		125	
	Q version (Q100 qualification)	–40		125	

- (1) V_{DDIO} and V_{DDA} should be maintained within –0.3 V of each other.
- (2) Group 2 pins are as follows: GPIO16, GPIO17, GPIO18, GPIO19, GPIO28, GPIO29, GPIO36, GPIO37.
- (3) T_A (Ambient temperature) is product- and application-dependent and can go up to the specified T_J max of the device.

5.3 Electrical Characteristics⁽¹⁾

over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT	
V _{OH}	High-level output voltage	I _{OH} = I _{OH} MAX		2.4			V	
		I _{OH} = 50 μA		V _{DDIO} – 0.2				
V _{OL}	Low-level output voltage	I _{OL} = I _{OL} MAX		0.4			V	
I _{IL}	Input current (low level)	Pin with pullup enabled	V _{DDIO} = 3.3 V, V _{IN} = 0 V	All GPIO/AIO	–80	–140	–205	μA
				$\overline{\text{XRS}}$ pin	–230	–300	–375	
I _{IH}	Input current (high level)	Pin with pulldown enabled	V _{DDIO} = 3.3 V, V _{IN} = 0 V	±2			μA	
		Pin with pullup enabled	V _{DDIO} = 3.3 V, V _{IN} = V _{DDIO}	±2				
I _{IH}	Input current (high level)	Pin with pulldown enabled	V _{DDIO} = 3.3 V, V _{IN} = V _{DDIO}	28	50	80	μA	
		Pin with pullup enabled	V _{DDIO} = 3.3 V, V _{IN} = V _{DDIO}					
I _{OZ}	Output current, pullup or pulldown disabled	V _O = V _{DDIO} or 0 V		±2			μA	
C _I	Input capacitance			2			pF	
	V _{DDIO} BOR trip point	Falling V _{DDIO}		2.50	2.78	2.96	V	
	V _{DDIO} BOR hysteresis			35			mV	
	Supervisor reset release delay time	Time after BOR/POR/OVR event is removed to $\overline{\text{XRS}}$ release		400		800	μs	
	VREG V _{DD} output	Internal VREG on		1.9			V	

(1) When the on-chip VREG is used, its output is monitored by the POR/BOR circuit, which will reset the device should the core voltage (V_{DD}) go out of range.

6 Peripheral and Electrical Specifications

6.1 Parameter Information

6.1.1 Timing Parameter Symbolology

Timing parameter symbols used are created in accordance with JEDEC Standard 100. To shorten the symbols, some of the pin names and other related terminology have been abbreviated as follows:

Lowercase subscripts and their meanings:

a	access time
c	cycle time (period)
d	delay time
f	fall time
h	hold time
r	rise time
su	setup time
t	transition time
v	valid time
w	pulse duration (width)

Letters and symbols and their meanings:

H	High
L	Low
V	Valid
X	Unknown, changing, or don't care level
Z	High impedance

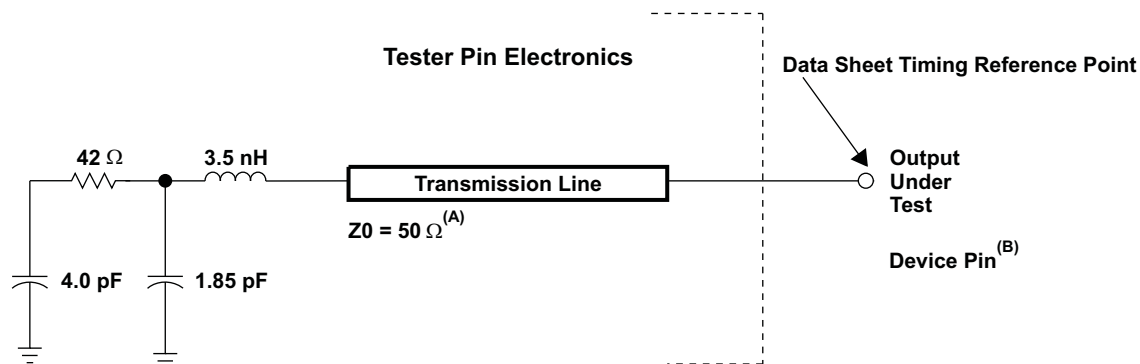

6.1.2 General Notes on Timing Parameters

All output signals from the 28x devices (including XCLKOUT) are derived from an internal clock such that all output transitions for a given half-cycle occur with a minimum of skewing relative to each other.

The signal combinations shown in the following timing diagrams may not necessarily represent actual cycles. For actual cycle examples, see the appropriate cycle description section of this document.

6.2 Test Load Circuit

This test load circuit is used to measure all switching characteristics provided in this document.

- A. Input requirements in this data sheet are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin.
- B. The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns or longer can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns or longer) from the data sheet timing.

Figure 6-1. 3.3-V Test Load Circuit

6.3 Device Clock Table

This section provides the timing requirements and switching characteristics for the various clock options available on the 2806x MCUs. [Table 6-1](#) lists the cycle times of various clocks.

Table 6-1. 2806x Clock Table and Nomenclature (80-MHz Devices)

		MIN	NOM	MAX	UNIT
SYSCLKOUT	$t_{c(SCO)}$, Cycle time	16.67		500	ns
	Frequency	2		80	MHz
LSPCLK ⁽¹⁾	$t_{c(LCO)}$, Cycle time	16.67	66.67 ⁽²⁾		ns
	Frequency		15 ⁽²⁾	80	MHz
ADC clock	$t_{c(ADCCLK)}$, Cycle time	16.67			ns
	Frequency			80	MHz

- (1) Lower LSPCLK will reduce device power consumption.
 (2) This is the default reset value if SYSCLKOUT = 80 MHz.

Table 6-2. Device Clocking Requirements/Characteristics

		MIN	NOM	MAX	UNIT
On-chip oscillator (X1/X2 pins) (Crystal/Resonator)	$t_{c(OSC)}$, Cycle time	50		200	ns
	Frequency	5		20	MHz
External oscillator/clock source (XCLKIN pin) — PLL Enabled	$t_{c(CI)}$, Cycle time (C8)	33.3		200	ns
	Frequency	5		30	MHz
External oscillator/clock source (XCLKIN pin) — PLL Disabled	$t_{c(CI)}$, Cycle time (C8)	33.33		250	ns
	Frequency	4		30	MHz
Limp mode SYSCLKOUT (with /2 enabled)	Frequency range		1 to 5		MHz
XCLKOUT	$t_{c(XCO)}$, Cycle time (C1)	66.67		2000	ns
	Frequency	0.5		15	MHz
PLL lock time ⁽¹⁾	t_p			1	ms

- (1) The PLLLOCKPRD register must be updated based on the number of OSCCLK cycles. If the zero-pin internal oscillators (10 MHz) are used as the clock source, then the PLLLOCKPRD register must be written with a value of 10,000 (minimum).

Table 6-3. Internal Zero-Pin Oscillator (INTOSC1/INTOSC2) Characteristics

PARAMETER		MIN	TYP	MAX	UNIT
Internal zero-pin oscillator 1 (INTOSC1) at 30°C ⁽¹⁾⁽²⁾	Frequency		10.000		MHz
Internal zero-pin oscillator 2 (INTOSC2) at 30°C ⁽¹⁾⁽²⁾	Frequency		10.000		MHz
Step size (coarse trim)			55		kHz
Step size (fine trim)			14		kHz
Temperature drift ⁽³⁾			3.03	4.85	kHz/°C
Voltage (V _{DD}) drift ⁽³⁾			175		Hz/mV

- (1) In order to achieve better oscillator accuracy (10 MHz ± 1% or better) than shown, refer to the *Oscillator Compensation Guide Application Report* (literature number [SPRAB84](#)).
- (2) Frequency range ensured only when VREG is enabled, $\overline{\text{VREGENZ}} = V_{\text{SS}}$.
- (3) Output frequency of the internal oscillators follows the direction of both the temperature gradient and voltage (V_{DD}) gradient. For example:
- Increase in temperature will cause the output frequency to increase per the temperature coefficient.
 - Decrease in voltage (V_{DD}) will cause the output frequency to decrease per the voltage coefficient.

ADVANCE INFORMATION

Figure 6-2. Zero-Pin Oscillator Frequency Movement With Temperature

6.4 Clock Requirements and Characteristics

Table 6-4. XCLKIN Timing Requirements - PLL Enabled

NO.			MIN	MAX	UNIT
C9	$t_{f(CI)}$	Fall time, XCLKIN		6	ns
C10	$t_{r(CI)}$	Rise time, XCLKIN		6	ns
C11	$t_{w(CIL)}$	Pulse duration, XCLKIN low as a percentage of $t_{c(OSCCLK)}$	45	55	%
C12	$t_{w(CIH)}$	Pulse duration, XCLKIN high as a percentage of $t_{c(OSCCLK)}$	45	55	%

Table 6-5. XCLKIN Timing Requirements - PLL Disabled

NO.			MIN	MAX	UNIT
C9	$t_{f(CI)}$	Fall time, XCLKIN	Up to 20 MHz	6	ns
			20 MHz to 30 MHz	2	
C10	$t_{r(CI)}$	Rise time, XCLKIN	Up to 20 MHz	6	ns
			20 MHz to 30 MHz	2	
C11	$t_{w(CIL)}$	Pulse duration, XCLKIN low as a percentage of $t_{c(OSCCLK)}$	45	55	%
C12	$t_{w(CIH)}$	Pulse duration, XCLKIN high as a percentage of $t_{c(OSCCLK)}$	45	55	%

The possible configuration modes are shown in [Table 3-18](#).

Table 6-6. XCLKOUT Switching Characteristics (PLL Bypassed or Enabled)⁽¹⁾⁽²⁾

NO.	PARAMETER	MIN	TYP	MAX	UNIT
C3	$t_{f(XCO)}$				ns
C4	$t_{r(XCO)}$				ns
C5	$t_{w(XCOL)}$	H - 2		H + 2	ns
C6	$t_{w(XCOH)}$	H - 2		H + 2	ns

(1) A load of 40 pF is assumed for these parameters.

(2) $H = 0.5t_{c(XCO)}$

- A. The relationship of XCLKIN to XCLKOUT depends on the divide factor chosen. The waveform relationship shown is intended to illustrate the timing parameters only and may differ based on actual configuration.
- B. XCLKOUT configured to reflect SYSCLKOUT.

Figure 6-3. Clock Timing

6.5 Power Sequencing

There is no power sequencing requirement needed to ensure the device is in the proper state after reset or to prevent the I/Os from glitching during power up/down. However, it is recommended that no voltage larger than a diode drop (0.7 V) should be applied to any pin prior to powering up the device. Voltages applied to pins on an unpowered device can bias internal p-n junctions in unintended ways and produce unpredictable results.

- Upon power up, SYSCCLKOUT is OSCCLK/4. Since the XCLKOUTDIV bits in the XCLK register come up with a reset state of 0, SYSCCLKOUT is further divided by 4 before it appears at XCLKOUT. XCLKOUT = OSCCLK/16 during this phase.
- Boot ROM configures the DIVSEL bits for /1 operation. XCLKOUT = OSCCLK/4 during this phase. Note that XCLKOUT will not be visible at the pin until explicitly configured by user code.
- After reset, the boot ROM code samples Boot Mode pins. Based on the status of the Boot Mode pin, the boot code branches to destination memory or boot code function. If boot ROM code executes after power-on conditions (in debugger environment), the boot code execution time is based on the current SYSCCLKOUT speed. The SYSCCLKOUT will be based on user environment and could be with or without PLL enabled.
- Using the \overline{XRS} pin is optional due to the on-chip power-on reset (POR) circuitry.

Figure 6-4. Power-on Reset

Table 6-7. Reset ($\overline{\text{XRS}}$) Timing Requirements

		MIN	NOM	MAX	UNIT
$t_{h(\text{boot-mode})}$	Hold time for boot-mode pins				cycles
$t_{w(\text{RSL2})}$	Pulse duration, $\overline{\text{XRS}}$ low on warm reset	$1000t_{c(\text{SCO})}$			cycles

Table 6-8. Reset ($\overline{\text{XRS}}$) Switching Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
$t_{w(\text{RSL1})}$	Pulse duration, $\overline{\text{XRS}}$ driven by device		600		μs
$t_{w(\text{WDRS})}$	Pulse duration, reset pulse generated by watchdog		$512t_{c(\text{OSCCLK})}$		cycles
$t_{d(\text{EX})}$	Delay time, address/data valid after $\overline{\text{XRS}}$ high		$32t_{c(\text{OSCCLK})}$		cycles
t_{INTOSCST}	Start up time, internal zero-pin oscillator		3		μs
$t_{\text{OSCST}}^{(1)}$	On-chip crystal-oscillator start-up time	1	10		ms

(1) Dependent on crystal/resonator and board design.

- A. After reset, the Boot ROM code samples BOOT Mode pins. Based on the status of the Boot Mode pin, the boot code branches to destination memory or boot code function. If Boot ROM code executes after power-on conditions (in debugger environment), the Boot code execution time is based on the current SYSCLKOUT speed. The SYSCLKOUT will be based on user environment and could be with or without PLL enabled.

Figure 6-5. Warm Reset

Figure 6-6 shows an example for the effect of writing into PLLCR register. In the first phase, PLLCR = 0x0004 and SYSCLKOUT = OSCCLK x 2. The PLLCR is then written with 0x0008. Right after the PLLCR register is written, the PLL lock-up phase begins. During this phase, SYSCLKOUT = OSCCLK/2. After the PLL lock-up is complete, SYSCLKOUT reflects the new operating frequency, OSCCLK x 4.

Figure 6-6. Example of Effect of Writing Into PLLCR Register

6.6 Current Consumption

Table 6-9. TMS320F2806x Current Consumption at 80-MHz SYSCLKOUT

MODE	TEST CONDITIONS	VREG ENABLED				VREG DISABLED					
		$I_{DDIO}^{(1)}$		$I_{DDA}^{(2)}$		I_{DD}		$I_{DDIO}^{(1)}$		$I_{DDA}^{(2)}$	
		TYP ⁽³⁾	MAX	TYP ⁽³⁾	MAX	TYP ⁽³⁾	MAX	TYP ⁽³⁾	MAX	TYP ⁽³⁾	MAX
Operational (Flash)	The following peripheral clocks are enabled: <ul style="list-style-type: none"> ePWM1/2/3/4/5/6/7/8 eCAP1/2/3 eQEP1/2 eCAN CLA HRPWM SCI-A/B SPI-A/B ADC I2C COMP1/2/3 CPU-TIMER0/1/2 McBSP HRCAP All PWM pins are toggled at 60 kHz. All I/O pins are left unconnected. ^{(4) (5)} Code is running out of flash with 2 wait-states. XCLKOUT is turned off.	140 mA ⁽⁶⁾		16 mA		130 mA ⁽⁶⁾		7 mA		16 mA	
IDLE	Flash is powered down. XCLKOUT is turned off. All peripheral clocks are turned off.	21 mA		300 μ A		18 mA		400 μ A		300 μ A	
STANDBY	Flash is powered down. Peripheral clocks are off.	7 mA		300 μ A		6 mA		400 μ A		300 μ A	
HALT	Flash is powered down. Peripheral clocks are off. Input clock is disabled. ⁽⁷⁾	3 mA		300 μ A		2 mA		120 μ A		300 μ A	

- I_{DDIO} current is dependent on the electrical loading on the I/O pins.
- In order to realize the I_{DDA} currents shown for IDLE, STANDBY, and HALT, clock to the ADC module must be turned off explicitly by writing to the PCLKCR0 register.
- The TYP numbers are applicable over room temperature and nominal voltage.
- The following is done in a loop:
 - Data is continuously transmitted out of SPI-A/B, SCI-A, eCAN-A, McBSP-A, and I2C ports.
 - The hardware multiplier is exercised.
 - Watchdog is reset.
 - ADC is performing continuous conversion.
 - COMP1/2 are continuously switching voltages.
 - GPIO17 is toggled.
- CLA is continuously performing polynomial calculations.
- For F2806x devices that do not have CLA, subtract the I_{DD} current number for CLA (see [Table 6-10](#)) from the I_{DD} (VREG disabled)/ I_{DDIO} (VREG enabled) current numbers shown in [Table 6-9](#) for operational mode.
- If a quartz crystal or ceramic resonator is used as the clock source, the HALT mode shuts down the on-chip crystal oscillator.

NOTE

The peripheral - I/O multiplexing implemented in the device prevents all available peripherals from being used at the same time. This is because more than one peripheral function may share an I/O pin. It is, however, possible to turn on the clocks to all the peripherals at the same time, although such a configuration is not useful. If this is done, the current drawn by the device will be more than the numbers specified in the current consumption tables.

6.6.1 Reducing Current Consumption

The 2806x devices incorporate a method to reduce the device current consumption. Since each peripheral unit has an individual clock-enable bit, significant reduction in current consumption can be achieved by turning off the clock to any peripheral module that is not used in a given application. Furthermore, any one of the three low-power modes could be taken advantage of to reduce the current consumption even further. Table 6-10 indicates the typical reduction in current consumption achieved by turning off the clocks.

Table 6-10. Typical Current Consumption by Various Peripherals (at 80 MHz)⁽¹⁾

PERIPHERAL MODULE ⁽²⁾	I _{DD} CURRENT REDUCTION (mA)
ADC	2 ⁽³⁾
I2C	3
ePWM	2
eCAP	2
eQEP	2
SCI	2
SPI	2
COMP/DAC	1
HRPWM	3
CPU-TIMER	1
Internal zero-pin oscillator	0.5
CAN	2.5
CLA	20
McBSP	6

- (1) All peripheral clocks (except CPU Timer clock) are disabled upon reset. Writing to/reading from peripheral registers is possible only after the peripheral clocks are turned on.
- (2) For peripherals with multiple instances, the current quoted is per module. For example, the 2 mA value quoted for ePWM is for one ePWM module.
- (3) This number represents the current drawn by the digital portion of the ADC module. Turning off the clock to the ADC module results in the elimination of the current drawn by the analog portion of the ADC (I_{DDA}) as well.

NOTE

I_{DDIO} current consumption is reduced by 15 mA (typical) when XCLKOUT is turned off.

NOTE

The baseline I_{DD} current (current when the core is executing a dummy loop with no peripherals enabled) is 40 mA, typical. To arrive at the I_{DD} current for a given application, the current-drawn by the peripherals (enabled by that application) must be added to the baseline I_{DD} current.

Following are other methods to reduce power consumption further:

- The flash module may be powered down if code is run off SARAM. This results in a current reduction of 18 mA (typical) in the V_{DD} rail and 13 mA (typical) in the V_{DDIO} rail.
- Savings in I_{DDIO} may be realized by disabling the pullups on pins that assume an output function.

6.7 Emulator Connection Without Signal Buffering for the MCU

Figure 6-7 shows the connection between the MCU and JTAG header for a single-processor configuration. If the distance between the JTAG header and the MCU is greater than 6 inches, the emulation signals must be buffered. If the distance is less than 6 inches, buffering is typically not needed. Figure 6-7 shows the simpler, no-buffering situation. For the pullup/pulldown resistor values, see Section 3.4, Signal Descriptions.

A. See Figure 6-46 for JTAG/GPIO multiplexing.

Figure 6-7. Emulator Connection Without Signal Buffering for the MCU

NOTE

The 2806x devices do not have EMU0/EMU1 pins. For designs that have a JTAG Header on-board, the EMU0/EMU1 pins on the header must be tied to V_{DDIO} through a 4.7-k Ω (typical) resistor.

6.8 Interrupts

Figure 6-8 shows how the various interrupt sources are multiplexed.

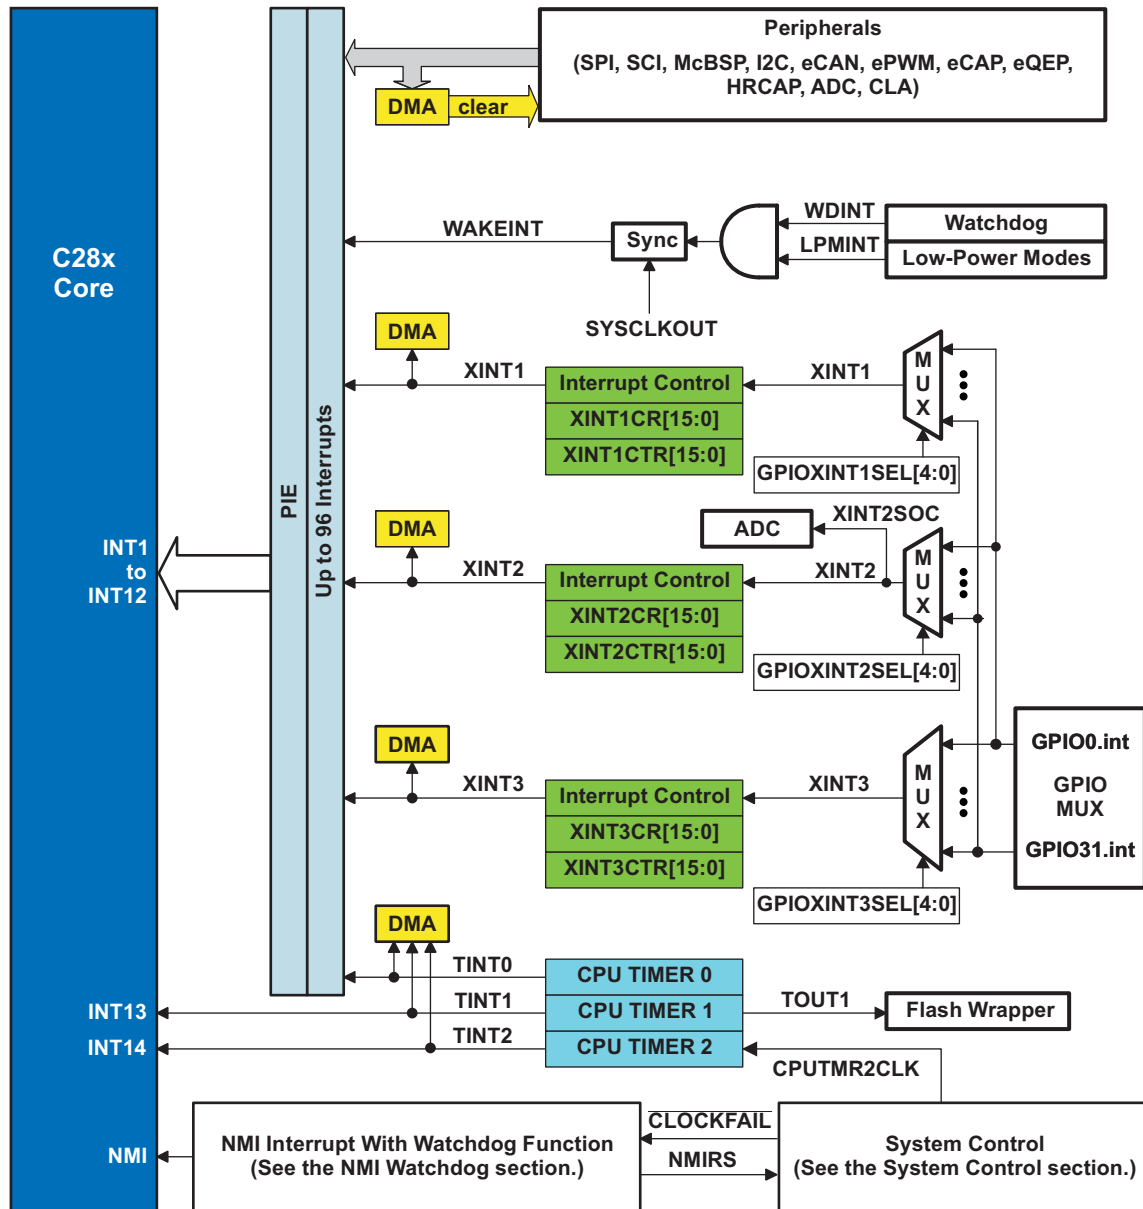

Figure 6-8. External and PIE Interrupt Sources

Eight PIE block interrupts are grouped into one CPU interrupt. In total, 12 CPU interrupt groups, with 8 interrupts per group equals 96 possible interrupts. Table 6-11 shows the interrupts used by 2806x devices.

The TRAP #VectorNumber instruction transfers program control to the interrupt service routine corresponding to the vector specified. TRAP #0 attempts to transfer program control to the address pointed to by the reset vector. The PIE vector table does not, however, include a reset vector. Therefore, TRAP #0 should not be used when the PIE is enabled. Doing so will result in undefined behavior.

When the PIE is enabled, TRAP #1 through TRAP #12 will transfer program control to the interrupt service routine corresponding to the first vector within the PIE group. For example: TRAP #1 fetches the vector from INT1.1, TRAP #2 fetches the vector from INT2.1, and so forth.

Figure 6-9. Multiplexing of Interrupts Using the PIE Block

- (1) Out of 96 possible interrupts, some interrupts are not used. These interrupts are reserved for future devices. These interrupts can be used as software interrupts if they are enabled at the PIEIFRx level, provided none of the interrupts within the group is being used by a peripheral. Otherwise, interrupts coming in from peripherals may be lost by accidentally clearing their flag while modifying the PIEIFR. To summarize, there are two safe cases when the reserved interrupts could be used as software interrupts:
- No peripheral within the group is asserting interrupts.
 - No peripheral interrupts are assigned to the group (e.g., PIE group 7).

(1) For an explanation of the input qualifier parameters, see [Table 6-67](#).

6.9 Control Law Accelerator (CLA) Overview

The control law accelerator extends the capabilities of the C28x CPU by adding parallel processing. Time-critical control loops serviced by the CLA can achieve low ADC sample to output delay. Thus, the CLA enables faster system response and higher frequency control loops. Utilizing the CLA for time-critical tasks frees up the main CPU to perform other system and communication functions concurrently. The following is a list of major features of the CLA.

- Clocked at the same rate as the main CPU (SYSCLKOUT).
- An independent architecture allowing CLA algorithm execution independent of the main C28x CPU.
 - Complete bus architecture:
 - Program address bus and program data bus
 - Data address bus, data read bus, and data write bus
 - Independent eight-stage pipeline.
 - 12-bit program counter (MPC)
 - Four 32-bit result registers (MR0–MR3)
 - Two 16-bit auxiliary registers (MAR0, MAR1)
 - Status register (MSTF)
- Instruction set includes:
 - IEEE single-precision (32-bit) floating-point math operations
 - Floating-point math with parallel load or store
 - Floating-point multiply with parallel add or subtract
 - 1/X and 1/sqrt(X) estimations
 - Data type conversions.
 - Conditional branch and call
 - Data load/store operations
- The CLA program code can consist of up to eight tasks or interrupt service routines.
 - The start address of each task is specified by the MVECT registers.
 - No limit on task size as long as the tasks fit within the CLA program memory space.
 - One task is serviced at a time through to completion. There is no nesting of tasks.
 - Upon task completion, a task-specific interrupt is flagged within the PIE.
 - When a task finishes, the next highest-priority pending task is automatically started.
- Task trigger mechanisms:
 - C28x CPU via the IACK instruction
 - Task1 to Task7: the corresponding ADC, ePWM, eQEP, or eCAP module interrupt. For example:
 - Task1: ADCINT1 or EPWM1_INT
 - Task2: ADCINT2 or EPWM2_INT
 - Task4: ADCINT4 or EPWM4_INT or EQEPx_INT or ECAPx_INT
 - Task7: ADCINT7 or EPWM7_INT or EQEPx_INT or ECAPx_INT
 - Task8: ADCINT8 or by CPU Timer 0 or EQEPx_INT or ECAPx_INT.
- Memory and Shared Peripherals:
 - Two dedicated message RAMs for communication between the CLA and the main CPU.
 - The C28x CPU can map CLA program and data memory to the main CPU space or CLA space.
 - The CLA has direct access to the ADC Result registers, comparator registers, and the eCAP, eQEP, and ePWM+HRPWM registers.

0x1500 – 0x157F	128	CPU to CLA Message RAM

6.10 Analog Block

A 12-bit ADC core is implemented that has different timings than the 12-bit ADC used on F280x/F2833x. The ADC wrapper is modified to incorporate the new timings and also other enhancements to improve the timing control of start of conversions. Figure 6-12 shows the interaction of the analog module with the rest of the F2806x system.

Figure 6-12. Analog Pin Configurations

6.10.1 Analog-to-Digital Converter (ADC)

6.10.1.1 Features

The core of the ADC contains a single 12-bit converter fed by two sample-and-hold circuits. The sample-and-hold circuits can be sampled simultaneously or sequentially. These, in turn, are fed by a total of up to 16 analog input channels. The converter can be configured to run with an internal bandgap reference to create true-voltage based conversions or with a pair of external voltage references (V_{REFHI}/V_{REFLO}) to create ratiometric-based conversions.

Contrary to previous ADC types, this ADC is not sequencer-based. It is easy for the user to create a series of conversions from a single trigger. However, the basic principle of operation is centered around the configurations of individual conversions, called SOCs, or Start-Of-Conversions.

Functions of the ADC module include:

- 12-bit ADC core with built-in dual sample-and-hold (S/H)
- Simultaneous sampling or sequential sampling modes
- Full range analog input: 0 V to 3.3 V fixed, or V_{REFHI}/V_{REFLO} ratiometric. The digital value of the input analog voltage is derived by:

- Internal Reference ($V_{REFLO} = V_{SSA}$. V_{REFHI} must not exceed V_{DDA} when using either internal or external reference modes.)

$$\text{Digital Value} = 0, \quad \text{when input} \leq 0 \text{ V}$$

$$\text{Digital Value} = 4096 \times \frac{\text{Input Analog Voltage} - V_{REFLO}}{3.3} \quad \text{when } 0 \text{ V} < \text{input} < 3.3 \text{ V}$$

$$\text{Digital Value} = 4095, \quad \text{when input} \geq 3.3 \text{ V}$$

- External Reference (V_{REFHI}/V_{REFLO} connected to external references. V_{REFHI} must not exceed V_{DDA} when using either internal or external reference modes.)

$$\text{Digital Value} = 0, \quad \text{when input} \leq 0 \text{ V}$$

$$\text{Digital Value} = 4096 \times \frac{\text{Input Analog Voltage} - V_{REFLO}}{V_{REFHI} - V_{REFLO}} \quad \text{when } 0 \text{ V} < \text{input} < V_{REFHI}$$

$$\text{Digital Value} = 4095, \quad \text{when input} \geq V_{REFHI}$$

- Runs at full system clock, no prescaling required
- Up to 16-channel, multiplexed inputs
- 16 SOCs, configurable for trigger, sample window, and channel
- 16 result registers (individually addressable) to store conversion values
- Multiple trigger sources
 - S/W – software immediate start
 - ePWM 1–8
 - GPIO XINT2
 - CPU Timers 0/1/2
 - ADCINT1/2
- 9 flexible PIE interrupts, can configure interrupt request after any conversion

ADCRESULT0 to ADCRESULT15	0xB00 – 0xB0F	1	No	ADC Result 0 Register to ADC Result 15 Register

Figure 6-13. ADC Connections

ADC Connections if the ADC is Not Used

It is recommended that the connections for the analog power pins be kept, even if the ADC is not used. Following is a summary of how the ADC pins should be connected, if the ADC is not used in an application:

- V_{DDA} – Connect to V_{DDIO}
- V_{SSA} – Connect to V_{SS}
- V_{REFLO} – Connect to V_{SS}
- $ADCINAn$, $ADCINBn$, V_{REFHI} – Connect to V_{SSA}

When the ADC module is used in an application, unused ADC input pins should be connected to analog ground (V_{SSA}).

NOTE: Unused ADCIN pins that are multiplexed with AIO function should not be directly connected to analog ground. They should be grounded through a 1-k Ω resistor. This is to prevent an errant code from configuring these pins as AIO outputs and driving grounded pins to a logic-high state.

When the ADC is not used, be sure that the clock to the ADC module is not turned on to realize power savings.

ADVANCE INFORMATION

6.10.1.2 ADC Start-of-Conversion Electrical Data/Timing

Table 6-20. External ADC Start-of-Conversion Switching Characteristics

PARAMETER	MIN	MAX	UNIT
$t_{w(ADCSOCL)}$ Pulse duration, $\overline{ADCSOCxO}$ low	$32t_{c(HCO)}$		cycles

Figure 6-14. ADCSOCAO or ADCSOCBO Timing

6.10.1.3 On-Chip Analog-to-Digital Converter (ADC) Electrical Data/Timing

Table 6-21. ADC Electrical Characteristics

PARAMETER	MIN	TYP	MAX	UNIT
DC SPECIFICATIONS				
Resolution		12		Bits
ADC clock	80-MHz device		40	MHz
Sample Window		7	64	ADC Clocks
ACCURACY				
INL (Integral nonlinearity) ⁽¹⁾	40-MHz clock (3 MSPS)		±2	LSB
DNL (Differential nonlinearity)			±1	LSB
Offset error ⁽²⁾	Executing Device_Cal function		10	LSB
	Executing periodic self-recalibration ⁽³⁾		10	
Overall gain error with internal reference			10	LSB
Overall gain error with external reference			10	LSB
Channel-to-channel offset variation			±4	LSB
Channel-to-channel gain variation			±4	LSB
ADC temperature coefficient with internal reference			-50	ppm/°C
ADC temperature coefficient with external reference			-20	ppm/°C
ANALOG INPUT				
Analog input voltage with internal reference		0	3.3	V
Analog input voltage with external reference		V_{REFLO}	V_{REFHI}	V
V_{REFLO} input voltage ⁽⁴⁾		V_{SSA}	0.66	V
V_{REFHI} input voltage ⁽⁵⁾		2.64	V_{DDA}	V
	with $V_{REFLO} = V_{SSA}$	1.98	V_{DDA}	
Input capacitance			5	pF
Input leakage current			±2	µA

- (1) INL will degrade when the ADC input voltage goes above V_{DDA} .
- (2) 1 LSB has the weighted value of full-scale range (FSR)/4096. FSR is 3.3 V with internal reference and $V_{REFHI} - V_{REFLO}$ for external reference.
- (3) Periodic self-recalibration will remove system-level and temperature dependencies on the ADC zero offset error.
- (4) V_{REFLO} is always connected to V_{SSA} on the 80-pin PN/PFP device.
- (5) V_{REFHI} must not exceed V_{DDA} when using either internal or external reference modes. Since V_{REFHI} is tied to ADCINA0 on the 80-pin PN/PFP device, the input signal on ADCINA0 must not exceed V_{DDA} .

Table 6-22. ADC Power Modes

ADC OPERATING MODE	CONDITIONS	I _{DDA}	UNITS
Mode A – Operating Mode	ADC Clock Enabled Bandgap On (ADCBGPWD = 1) Reference On (ADCREFPWD = 1) ADC Powered Up (ADCPWRDN = 1)	13	mA
Mode B – Quick Wake Mode	ADC Clock Enabled Bandgap On (ADCBGPWD = 1) Reference On (ADCREFPWD = 1) ADC Powered Up (ADCPWRDN = 0)	4	mA
Mode C – Comparator-Only Mode	ADC Clock Enabled Bandgap On (ADCBGPWD = 1) Reference On (ADCREFPWD = 0) ADC Powered Up (ADCPWRDN = 0)	1.5	mA
Mode D – Off Mode	ADC Clock Enabled Bandgap On (ADCBGPWD = 0) Reference On (ADCREFPWD = 0) ADC Powered Up (ADCPWRDN = 0)	0.075	mA

6.10.1.3.1 Internal Temperature Sensor

Table 6-23. Temperature Sensor Coefficient

PARAMETER ⁽¹⁾		MIN	TYP	MAX	UNIT
T _{SLOPE}	Degrees C of temperature movement per measured ADC LSB change of the temperature sensor		0.18 ⁽²⁾⁽³⁾		°C/LSB
T _{OFFSET}	ADC output at 0°C of the temperature sensor		1750		LSB

- (1) The temperature sensor slope and offset are given in terms of ADC LSBs using the internal reference of the ADC. Values must be adjusted accordingly in external reference mode to the external reference voltage.
- (2) ADC temperature coefficient is accounted for in this specification
- (3) Output of the temperature sensor (in terms of LSBs) is sign-consistent with the direction of the temperature movement. Increasing temperatures will give increasing ADC values relative to an initial value; decreasing temperatures will give decreasing ADC values relative to an initial value.

6.10.1.3.2 ADC Power-Up Control Bit Timing

Table 6-24. ADC Power-Up Delays

PARAMETER ⁽¹⁾		MIN	TYP	MAX	UNIT
t _{d(PWD)}	Delay time for the ADC to be stable after power up			1	ms

- (1) Timings maintain compatibility to the ADC module. The 2806x ADC supports driving all 3 bits at the same time t_{d(PWD)} ms before first conversion.

Figure 6-15. ADC Conversion Timing

Typical Values of the Input Circuit Components:

- Switch Resistance (R_{on}): 3.4 k Ω
- Sampling Capacitor (C_h): 1.6 pF
- Parasitic Capacitance (C_p): 5 pF
- Source Resistance (R_s): 50 Ω

Figure 6-16. ADC Input Impedance Model

6.10.1.3.3 ADC Sequential and Simultaneous Timings

6.10.3 Comparator Block

Figure 6-22 shows the interaction of the Comparator modules with the rest of the system.

Figure 6-22. Comparator Block Diagram

Table 6-25. Comparator Control Registers

REGISTER NAME	COMP1 ADDRESS	COMP2 ADDRESS	COMP3 ADDRESS	SIZE (x16)	EALLOW PROTECTED	DESCRIPTION
COMPCTL	0x6400	0x6420	0x6440	1	Yes	Comparator Control Register
COMPSTS	0x6402	0x6422	0x6442	1	No	Comparator Status Register
DACVAL	0x6406	0x6426	0x6446	1	Yes	DAC Value Register

6.10.3.1 On-Chip Comparator/DAC Electrical Data/Timing

Table 6-26. Electrical Characteristics of the Comparator/DAC

CHARACTERISTIC	MIN	TYP	MAX	UNITS
Comparator				
Comparator Input Range	$V_{SSA} - V_{DDA}$			V
Comparator response time to PWM Trip Zone (Async)	30			ns
Input Offset	± 5			mV
Input Hysteresis ⁽¹⁾	35			mV
DAC				
DAC Output Range	$V_{SSA} - V_{DDA}$			V
DAC resolution	10			bits
DAC settling time	See Figure 6-23			
DAC Gain	-1.5			%
DAC Offset	10			mV
Monotonic	Yes			
INL	± 3			LSB

(1) Hysteresis on the comparator inputs is achieved with a Schmidt trigger configuration. This results in an effective 100-kΩ feedback resistance between the output of the comparator and the non-inverting input of the comparator.

Figure 6-23. DAC Settling Time

ADVANCE INFORMATION

6.11 Detailed Descriptions

Integral Nonlinearity

Integral nonlinearity refers to the deviation of each individual code from a line drawn from zero through full scale. The point used as zero occurs one-half LSB before the first code transition. The full-scale point is defined as level one-half LSB beyond the last code transition. The deviation is measured from the center of each particular code to the true straight line between these two points.

Differential Nonlinearity

An ideal ADC exhibits code transitions that are exactly 1 LSB apart. DNL is the deviation from this ideal value. A differential nonlinearity error of less than ± 1 LSB ensures no missing codes.

Zero Offset

The major carry transition should occur when the analog input is at zero volts. Zero error is defined as the deviation of the actual transition from that point.

Gain Error

The first code transition should occur at an analog value one-half LSB above negative full scale. The last transition should occur at an analog value one and one-half LSB below the nominal full scale. Gain error is the deviation of the actual difference between first and last code transitions and the ideal difference between first and last code transitions.

Signal-to-Noise Ratio + Distortion (SINAD)

SINAD is the ratio of the rms value of the measured input signal to the rms sum of all other spectral components below the Nyquist frequency, including harmonics but excluding dc. The value for SINAD is expressed in decibels.

Effective Number of Bits (ENOB)

For a sine wave, SINAD can be expressed in terms of the number of bits. Using the following formula,
$$N = \frac{(\text{SINAD} - 1.76)}{6.02}$$
 it is possible to get a measure of performance expressed as N, the effective number of bits. Thus, effective number of bits for a device for sine wave inputs at a given input frequency can be calculated directly from its measured SINAD.

Total Harmonic Distortion (THD)

THD is the ratio of the rms sum of the first nine harmonic components to the rms value of the measured input signal and is expressed as a percentage or in decibels.

Spurious Free Dynamic Range (SFDR)

SFDR is the difference in dB between the rms amplitude of the input signal and the peak spurious signal.

6.12 Serial Peripheral Interface (SPI) Module

The device includes the four-pin serial peripheral interface (SPI) module. Up to two SPI modules are available. The SPI is a high-speed, synchronous serial I/O port that allows a serial bit stream of programmed length (one to sixteen bits) to be shifted into and out of the device at a programmable bit-transfer rate. Normally, the SPI is used for communications between the MCU and external peripherals or another processor. Typical applications include external I/O or peripheral expansion through devices such as shift registers, display drivers, and ADCs. Multidevice communications are supported by the master/slave operation of the SPI.

The SPI module features include:

- Four external pins:
 - SPISOMI: SPI slave-output/master-input pin
 - SPISIMO: SPI slave-input/master-output pin
 - $\overline{\text{SPISTE}}$: SPI slave transmit-enable pin
 - SPICLK: SPI serial-clock pin

NOTE: All four pins can be used as GPIO if the SPI module is not used.

- Two operational modes: master and slave
Baud rate: 125 different programmable rates.

$$\text{Baud rate} = \frac{\text{LSPCLK}}{(\text{SPIBRR} + 1)} \quad \text{when SPIBRR} = 3 \text{ to } 127$$

$$\text{Baud rate} = \frac{\text{LSPCLK}}{4} \quad \text{when SPIBRR} = 0, 1, 2$$

- Data word length: one to sixteen data bits
- Four clocking schemes (controlled by clock polarity and clock phase bits) include:
 - Falling edge without phase delay: SPICLK active-high. SPI transmits data on the falling edge of the SPICLK signal and receives data on the rising edge of the SPICLK signal.
 - Falling edge with phase delay: SPICLK active-high. SPI transmits data one half-cycle ahead of the falling edge of the SPICLK signal and receives data on the falling edge of the SPICLK signal.
 - Rising edge without phase delay: SPICLK inactive-low. SPI transmits data on the rising edge of the SPICLK signal and receives data on the falling edge of the SPICLK signal.
 - Rising edge with phase delay: SPICLK inactive-low. SPI transmits data one half-cycle ahead of the falling edge of the SPICLK signal and receives data on the rising edge of the SPICLK signal.
- Simultaneous receive and transmit operation (transmit function can be disabled in software)
- Transmitter and receiver operations are accomplished through either interrupt-driven or polled algorithms.
- Nine SPI module control registers: Located in control register frame beginning at address 7040h.

NOTE

All registers in this module are 16-bit registers that are connected to Peripheral Frame 2. When a register is accessed, the register data is in the lower byte (7–0), and the upper byte (15–8) is read as zeros. Writing to the upper byte has no effect.

Enhanced feature:

- 4-level transmit/receive FIFO
- Delayed transmit control
- Bi-directional 3 wire SPI mode support
- Audio data receive support via $\overline{\text{SPISTE}}$ inversion

The SPI port operation is configured and controlled by the registers listed in [Table 6-27](#) and [Table 6-28](#).

Table 6-27. SPI-A Registers

NAME	ADDRESS	SIZE (x16)	EALLOW PROTECTED	DESCRIPTION ⁽¹⁾
SPICCR	0x7040	1	No	SPI-A Configuration Control Register
SPICTL	0x7041	1	No	SPI-A Operation Control Register
SPISTS	0x7042	1	No	SPI-A Status Register
SPIBRR	0x7044	1	No	SPI-A Baud Rate Register
SPIRXEMU	0x7046	1	No	SPI-A Receive Emulation Buffer Register
SPIRXBUF	0x7047	1	No	SPI-A Serial Input Buffer Register
SPITXBUF	0x7048	1	No	SPI-A Serial Output Buffer Register
SPIDAT	0x7049	1	No	SPI-A Serial Data Register
SPIFFTX	0x704A	1	No	SPI-A FIFO Transmit Register
SPIFFRX	0x704B	1	No	SPI-A FIFO Receive Register
SPIFFCT	0x704C	1	No	SPI-A FIFO Control Register
SPIPRI	0x704F	1	No	SPI-A Priority Control Register

(1) Registers in this table are mapped to Peripheral Frame 2. This space only allows 16-bit accesses. 32-bit accesses produce undefined results.

Table 6-28. SPI-B Registers

NAME	ADDRESS	SIZE (x16)	EALLOW PROTECTED	DESCRIPTION ⁽¹⁾
SPICCR	0x7740	1	No	SPI-B Configuration Control Register
SPICTL	0x7741	1	No	SPI-B Operation Control Register
SPISTS	0x7742	1	No	SPI-B Status Register
SPIBRR	0x7744	1	No	SPI-B Baud Rate Register
SPIRXEMU	0x7746	1	No	SPI-B Receive Emulation Buffer Register
SPIRXBUF	0x7747	1	No	SPI-B Serial Input Buffer Register
SPITXBUF	0x7748	1	No	SPI-B Serial Output Buffer Register
SPIDAT	0x7749	1	No	SPI-B Serial Data Register
SPIFFTX	0x774A	1	No	SPI-B FIFO Transmit Register
SPIFFRX	0x774B	1	No	SPI-B FIFO Receive Register
SPIFFCT	0x774C	1	No	SPI-B FIFO Control Register
SPIPRI	0x774F	1	No	SPI-B Priority Control Register

(1) Registers in this table are mapped to Peripheral Frame 2. This space only allows 16-bit accesses. 32-bit accesses produce undefined results.

Figure 6-24 is a block diagram of the SPI in slave mode.

A. $\overline{\text{SPISTE}}$ is driven low by the master for a slave device.

Figure 6-24. SPI Module Block Diagram (Slave Mode)

6.12.1 Serial Peripheral Interface (SPI) Master Mode Electrical Data/ Timing

Table 6-29 lists the master mode timing (clock phase = 0) and Table 6-30 lists the master mode timing (clock phase = 1). Figure 6-25 and Figure 6-26 show the timing waveforms.

- (4) $t_{c(LCO)}$ = LSPCLK cycle time
- (5) The active edge of the SPICLK signal referenced is controlled by the CLOCK POLARITY bit (SPICCR.6).

- C. In the slave mode, the \overline{SPISTE} signal should be asserted low at least $0.5t_{c(SPC)}$ (minimum) before the valid SPI clock edge and remain low for at least $0.5t_{c(SPC)}$ after the receiving edge (SPICLK) of the last data bit.

Figure 6-27. SPI Slave Mode External Timing (Clock Phase = 0)

Table 6-32. SPI Slave Mode External Timing (Clock Phase = 1)⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾⁽⁵⁾

NO.			MIN	MAX	UNIT
12	$t_{c(SPC)S}$	Cycle time, SPICLK	$8t_{c(LCO)}$		ns
13	$t_{w(SPCH)S}$	Pulse duration, SPICLK high (clock polarity = 0)	$0.5t_{c(SPC)S} - 10$	$0.5t_{c(SPC)S}$	ns
	$t_{w(SPCL)S}$	Pulse duration, SPICLK low (clock polarity = 1)	$0.5t_{c(SPC)S} - 10$	$0.5t_{c(SPC)S}$	
14	$t_{w(SPCL)S}$	Pulse duration, SPICLK low (clock polarity = 0)	$0.5t_{c(SPC)S} - 10$	$0.5t_{c(SPC)S}$	ns
	$t_{w(SPCH)S}$	Pulse duration, SPICLK high (clock polarity = 1)	$0.5t_{c(SPC)S} - 10$	$0.5t_{c(SPC)S}$	
17	$t_{su(SOMI-SPCH)S}$	Setup time, SPISOMI before SPICLK high (clock polarity = 0)	$0.125t_{c(SPC)S}$		ns
	$t_{su(SOMI-SPCL)S}$	Setup time, SPISOMI before SPICLK low (clock polarity = 1)	$0.125t_{c(SPC)S}$		
18	$t_{v(SPCL-SOMI)S}$	Valid time, SPISOMI data valid after SPICLK low (clock polarity = 1)	$0.75t_{c(SPC)S}$		ns
	$t_{v(SPCH-SOMI)S}$	Valid time, SPISOMI data valid after SPICLK high (clock polarity = 0)	$0.75t_{c(SPC)S}$		
21	$t_{su(SIMO-SPCH)S}$	Setup time, SPISIMO before SPICLK high (clock polarity = 0)	35		ns
	$t_{su(SIMO-SPCL)S}$	Setup time, SPISIMO before SPICLK low (clock polarity = 1)	35		
22	$t_{v(SPCH-SIMO)S}$	Valid time, SPISIMO data valid after SPICLK high (clock polarity = 0)	$0.5t_{c(SPC)S} - 10$		ns
	$t_{v(SPCL-SIMO)S}$	Valid time, SPISIMO data valid after SPICLK low (clock polarity = 1)	$0.5t_{c(SPC)S} - 10$		

- (1) The MASTER / SLAVE bit (SPICTL.2) is cleared and the CLOCK PHASE bit (SPICTL.3) is cleared.
- (2) $t_{c(SPC)}$ = SPI clock cycle time = LSPCLK/4 or LSPCLK/(SPIBRR + 1)
- (3) $t_{c(LCO)}$ = LSPCLK cycle time
- (4) Internal clock prescalers must be adjusted such that the SPI clock speed is limited to the following SPI clock rate:
Master mode transmit 15-MHz MAX, master mode receive 10-MHz MAX
Slave mode transmit 10-MHz MAX, slave mode receive 10-MHz MAX.
- (5) The active edge of the SPICLK signal referenced is controlled by the CLOCK POLARITY bit (SPICCR.6).

- A. In the slave mode, the \overline{SPISTE} signal should be asserted low at least $0.5t_{c(SPC)}$ before the valid SPI clock edge and remain low for at least $0.5t_{c(SPC)}$ after the receiving edge (SPICLK) of the last data bit.

Figure 6-28. SPI Slave Mode External Timing (Clock Phase = 1)

6.13 Serial Communications Interface (SCI) Module

The devices include up to two serial communications interface (SCI) modules (SCI-A, SCI-B). The SCI module supports digital communications between the CPU and other asynchronous peripherals that use the standard non-return-to-zero (NRZ) format. The SCI receiver and transmitter are double-buffered, and each has its own separate enable and interrupt bits. Both can be operated independently or simultaneously in the full-duplex mode. To ensure data integrity, the SCI checks received data for break detection, parity, overrun, and framing errors. The bit rate is programmable to over 65000 different speeds through a 16-bit baud-select register.

Features of each SCI module include:

- Two external pins:
 - SCITXD: SCI transmit-output pin
 - SCIRXD: SCI receive-input pin
- NOTE:** Both pins can be used as GPIO if not used for SCI.
- Baud rate programmable to 64K different rates:

$$\text{Baud rate} = \frac{\text{LSPCLK}}{(\text{BRR} + 1) * 8} \quad \text{when BRR} \neq 0$$

$$\text{Baud rate} = \frac{\text{LSPCLK}}{16} \quad \text{when BRR} = 0$$

- Data-word format
 - One start bit
 - Data-word length programmable from one to eight bits
 - Optional even/odd/no parity bit
 - One or two stop bits
- Four error-detection flags: parity, overrun, framing, and break detection
- Two wake-up multiprocessor modes: idle-line and address bit
- Half- or full-duplex operation
- Double-buffered receive and transmit functions
- Transmitter and receiver operations can be accomplished through interrupt-driven or polled algorithms with status flags.
 - Transmitter: TXRDY flag (transmitter-buffer register is ready to receive another character) and TX EMPTY flag (transmitter-shift register is empty)
 - Receiver: RXRDY flag (receiver-buffer register is ready to receive another character), BRKDT flag (break condition occurred), and RX ERROR flag (monitoring four interrupt conditions)
- Separate enable bits for transmitter and receiver interrupts (except BRKDT)
- NRZ (non-return-to-zero) format

NOTE

All registers in this module are 8-bit registers that are connected to Peripheral Frame 2. When a register is accessed, the register data is in the lower byte (7–0), and the upper byte (15–8) is read as zeros. Writing to the upper byte has no effect.

Enhanced features:

- Auto baud-detect hardware logic
- 4-level transmit/receive FIFO

The SCI port operation is configured and controlled by the registers listed in [Table 6-33](#) and [Table 6-34](#).

Table 6-33. SCI-A Registers⁽¹⁾

NAME	ADDRESS	SIZE (x16)	EALLOW PROTECTED	DESCRIPTION
SCICCRA	0x7050	1	No	SCI-A Communications Control Register
SCICTL1A	0x7051	1	No	SCI-A Control Register 1

ADVANCE INFORMATION

6.14 Multichannel Buffered Serial Port (McBSP) Module

The McBSP module has the following features:

- Compatible to McBSP in TMS320C54x™/ TMS320C55x™ DSP devices
- Full-duplex communication
- Double-buffered data registers that allow a continuous data stream
- Independent framing and clocking for receive and transmit
- External shift clock generation or an internal programmable frequency shift clock
- A wide selection of data sizes including 8-, 12-, 16-, 20-, 24-, or 32-bits
- 8-bit data transfers with LSB or MSB first
- Programmable polarity for both frame synchronization and data clocks
- Highly programmable internal clock and frame generation
- Direct interface to industry-standard CODECs, Analog Interface Chips (AICs), and other serially connected A/D and D/A devices
- Works with SPI-compatible devices
- The following application interfaces can be supported on the McBSP:
 - T1/E1 framers
 - IOM-2 compliant devices
 - AC97-compliant devices (the necessary multiphase frame synchronization capability is provided.)
 - IIS-compliant devices
 - SPI
- McBSP clock rate,

$$CLKG = \frac{CLKSRG}{(1 + CLKGDV)}$$

where CLKSRG source could be LSPCLK, CLKX, or CLKR. Serial port performance is limited by I/O buffer switching speed. Internal prescalers must be adjusted such that the peripheral speed is less than the I/O buffer speed limit.

NOTE

See [Section 6](#) for maximum I/O pin toggling speed.

Figure 6-30 shows the block diagram of the McBSP module.

Figure 6-30. McBSP Module

ADVANCE INFORMATION

6.15 Enhanced Controller Area Network (eCAN) Module

The CAN module (eCAN-A) has the following features:

- Fully compliant with CAN protocol, version 2.0B
- Supports data rates up to 1 Mbps
- Thirty-two mailboxes, each with the following properties:
 - Configurable as receive or transmit
 - Configurable with standard or extended identifier
 - Has a programmable receive mask
 - Supports data and remote frame
 - Composed of 0 to 8 bytes of data
 - Uses a 32-bit time stamp on receive and transmit message
 - Protects against reception of new message
 - Holds the dynamically programmable priority of transmit message
 - Employs a programmable interrupt scheme with two interrupt levels
 - Employs a programmable alarm on transmission or reception time-out
- Low-power mode
- Programmable wake-up on bus activity
- Automatic reply to a remote request message
- Automatic retransmission of a frame in case of loss of arbitration or error
- 32-bit local network time counter synchronized by a specific message (communication in conjunction with mailbox 16)
- Self-test mode
 - Operates in a loopback mode receiving its own message. A "dummy" acknowledge is provided, thereby eliminating the need for another node to provide the acknowledge bit.

NOTE

For a SYSCLKOUT of 60 MHz, the smallest bit rate possible is 9.375 kbps.

The F2806x CAN has passed the conformance test per ISO/DIS 16845. Contact TI for test report and exceptions.

ADVANCE INFORMATION

Figure 6-38. eCAN-A Memory Map

NOTE

If the eCAN module is not used in an application, the RAM available (LAM, MOTS, MOTO, and mailbox RAM) can be used as general-purpose RAM. The CAN module clock should be enabled for this.

The CAN registers listed in [Table 6-47](#) are used by the CPU to configure and control the CAN controller and the message objects. eCAN control registers only support 32-bit read/write operations. Mailbox RAM can be accessed as 16 bits or 32 bits. 32-bit accesses are aligned to an even boundary.

Table 6-47. CAN Register Map⁽¹⁾

REGISTER NAME	eCAN-A ADDRESS	SIZE (x32)	DESCRIPTION

(1) These registers are mapped to Peripheral Frame 1.

6.16 Inter-Integrated Circuit (I2C)

The device contains one I2C Serial Port. [Figure 6-39](#) shows how the I2C peripheral module interfaces within the device.

The I2C module has the following features:

- Compliance with the Philips Semiconductors I2C-bus specification (version 2.1):
 - Support for 1-bit to 8-bit format transfers
 - 7-bit and 10-bit addressing modes
 - General call
 - START byte mode
 - Support for multiple master-transmitters and slave-receivers
 - Support for multiple slave-transmitters and master-receivers
 - Combined master transmit/receive and receive/transmit mode
 - Data transfer rate of from 10 kbps up to 400 kbps (I2C Fast-mode rate)
- One 4-word receive FIFO and one 4-word transmit FIFO
- One interrupt that can be used by the CPU. This interrupt can be generated as a result of one of the following conditions:
 - Transmit-data ready
 - Receive-data ready
 - Register-access ready
 - No-acknowledgment received
 - Arbitration lost
 - Stop condition detected
 - Addressed as slave
- An additional interrupt that can be used by the CPU when in FIFO mode
- Module enable/disable capability
- Free data format mode

- The I2C registers are accessed at the SYSCLKOUT rate. The internal timing and signal waveforms of the I2C port are also at the SYSCLKOUT rate.
- The clock enable bit (I2CAENCLK) in the PCLKCRO register turns off the clock to the I2C port for low power operation. Upon reset, I2CAENCLK is clear, which indicates the peripheral internal clocks are off.

Figure 6-39. I2C Peripheral Module Interfaces

The registers in [Table 6-48](#) configure and control the I2C port operation.

Table 6-48. I2C-A Registers

NAME	ADDRESS	EALLOW PROTECTED	DESCRIPTION

6.16.1 Inter-Integrated Circuit (I2C) Electrical Data/Timing

Table 6-49. I2C Timing

		TEST CONDITIONS	MIN	MAX	UNIT
f_{SCL}	SCL clock frequency	I2C clock module frequency is between 7 MHz and 12 MHz and I2C prescaler and clock divider registers are configured appropriately		400	kHz
V_{il}	Low level input voltage			$0.3 V_{DDIO}$	V
V_{ih}	High level input voltage		$0.7 V_{DDIO}$		V
V_{hys}	Input hysteresis		$0.05 V_{DDIO}$		V
V_{ol}	Low level output voltage	3 mA sink current	0	0.4	V
t_{LOW}	Low period of SCL clock	I2C clock module frequency is between 7 MHz and 12 MHz and I2C prescaler and clock divider registers are configured appropriately	1.3		μs
t_{HIGH}	High period of SCL clock	I2C clock module frequency is between 7 MHz and 12 MHz and I2C prescaler and clock divider registers are configured appropriately	0.6		μs
I_I	Input current with an input voltage between $0.1 V_{DDIO}$ and $0.9 V_{DDIO}$ MAX		-10	10	μA

6.17 Enhanced Pulse Width Modulator (ePWM) Modules (ePWM1/2/3/4/5/6/7/8)

The devices contain up to eight enhanced PWM Modules (ePWM). Figure 6-40 shows a block diagram of multiple ePWM modules. Figure 6-41 shows the signal interconnections with the ePWM.

Table 6-50 and Table 6-51 show the complete ePWM register set per module.

ADVANCE INFORMATION

A. This signal exists only on devices with an eQEP1 module.

- A. These events are generated by the Type 1 ePWM digital compare (DC) submodule based on the levels of the COMPxOUT and TZ signals.
- B. This signal exists only on devices with an eQEP1 module.

Figure 6-41. ePWM Sub-Modules Showing Critical Internal Signal Interconnections

ADVANCE INFORMATION

6.17.1 Enhanced Pulse Width Modulator (ePWM) Electrical Data/Timing

PWM refers to PWM outputs on ePWM1–8. Table 6-52 shows the PWM timing requirements and Table 6-53, switching characteristics.

Table 6-52. ePWM Timing Requirements⁽¹⁾

		TEST CONDITIONS	MIN	MAX	UNIT
$t_{w(\text{SYCIN})}$	Sync input pulse width	Asynchronous	$2t_{c(\text{SCO})}$		cycles
		Synchronous	$2t_{c(\text{SCO})}$		cycles
		With input qualifier	$1t_{c(\text{SCO})} + t_{w(\text{IQSW})}$		cycles

(1) For an explanation of the input qualifier parameters, see Table 6-67.

Table 6-53. ePWM Switching Characteristics

PARAMETER	TEST CONDITIONS	MIN	MAX	UNIT
$t_{w(\text{PWM})}$	Pulse duration, PWMx output high/low	33.33		ns
$t_{w(\text{SYNCOUT})}$	Sync output pulse width	$8t_{c(\text{SCO})}$		cycles
$t_{d(\text{PWM})\text{tza}}$	Delay time, trip input active to PWM forced high		25	ns
	Delay time, trip input active to PWM forced low	no pin load		
$t_{d(\text{TZ-PWM})\text{HZ}}$	Delay time, trip input active to PWM Hi-Z		20	ns

6.17.2 Trip-Zone Input Timing

Table 6-54. Trip-Zone Input Timing Requirements⁽¹⁾

		TEST CONDITIONS	MIN	MAX	UNIT
$t_{w(\text{TZ})}$	Pulse duration, $\overline{\text{TZx}}$ input low	Asynchronous	$1t_{c(\text{SCO})}$		cycles
		Synchronous	$2t_{c(\text{SCO})}$		cycles
		With input qualifier	$1t_{c(\text{SCO})} + t_{w(\text{IQSW})}$		cycles

(1) For an explanation of the input qualifier parameters, see Table 6-67.

C. $\overline{\text{TZ}} - \overline{\text{TZ1}}, \overline{\text{TZ2}}, \overline{\text{TZ3}}, \overline{\text{TZ4}}, \overline{\text{TZ5}}, \overline{\text{TZ6}}$

D. PWM refers to all the PWM pins in the device. The state of the PWM pins after $\overline{\text{TZ}}$ is taken high depends on the PWM recovery software.

Figure 6-42. PWM Hi-Z Characteristics

6.18 High-Resolution PWM (HRPWM)

This module combines multiple delay lines in a single module and a simplified calibration system by using a dedicated calibration delay line. For each ePWM module there is one HR delay line.

The HRPWM module offers PWM resolution (time granularity) that is significantly better than what can be achieved using conventionally derived digital PWM methods. The key points for the HRPWM module are:

- Significantly extends the time resolution capabilities of conventionally derived digital PWM
- This capability can be utilized in both single edge (duty cycle and phase-shift control) as well as dual edge control for frequency/period modulation.
- Finer time granularity control or edge positioning is controlled via extensions to the Compare A and Phase registers of the ePWM module.
- HRPWM capabilities, when available on a particular device, are offered only on the A signal path of an ePWM module (i.e., on the EPWMxA output). EPWMxB output has conventional PWM capabilities.

NOTE

The minimum SYSCLKOUT frequency allowed for HRPWM is 60 MHz.

NOTE

When dual-edge high-resolution is enabled (high-resolution period mode), the PWMxB output is not available for use.

6.18.1 High-Resolution PWM (HRPWM) Electrical Data/Timing

Table 6-55 shows the high-resolution PWM switching characteristics.

Table 6-55. High-Resolution PWM Characteristics⁽¹⁾

	MIN	TYP	MAX	UNIT
Micro Edge Positioning (MEP) step size ⁽²⁾		150	310	ps

(1) The HRPWM operates at a minimum SYSCLKOUT frequency of 60 MHz.

(2) Maximum MEP step size is based on worst-case process, maximum temperature and maximum voltage. MEP step size will increase with low voltage and high temperature and decrease with voltage and cold temperature. Applications that use the HRPWM feature should use MEP Scale Factor Optimizer (SFO) estimation software functions. See the TI software libraries for details of using SFO function in end applications. SFO functions help to estimate the number of MEP steps per SYSCLKOUT period dynamically while the HRPWM is in operation.

6.19 Enhanced Capture Module (eCAP1)

The device contains an enhanced capture (eCAP) module. Figure 6-43 shows a functional block diagram of a module.

Figure 6-43. eCAP Functional Block Diagram

The eCAP module is clocked at the SYSCLKOUT rate.

The clock enable bits (ECAP1 ENCLK) in the PCLKCR1 register turn off the eCAP module individually (for low-power operation). Upon reset, ECAP1ENCLK is set to low, indicating that the peripheral clock is off.

6.19.1 Enhanced Capture (eCAP) Electrical Data/Timing

Table 6-57 shows the eCAP timing requirement and Table 6-58 shows the eCAP switching characteristics.

Table 6-57. Enhanced Capture (eCAP) Timing Requirement⁽¹⁾

		TEST CONDITIONS	MIN	MAX	UNIT
$t_{w(CAP)}$	Capture input pulse width	Asynchronous	$2t_{c(SCO)}$		cycles
		Synchronous	$2t_{c(SCO)}$		cycles
		With input qualifier	$1t_{c(SCO)} + t_{w(IQSW)}$		cycles

(1) For an explanation of the input qualifier parameters, see Table 6-67.

Table 6-58. eCAP Switching Characteristics

PARAMETER	TEST CONDITIONS	MIN	MAX	UNIT
$t_{w(APWM)}$	Pulse duration, APWMx output high/low	20		ns

6.20 High-Resolution Capture (HRCAP) Module

The High-Resolution Capture (HRCAP) module measures the difference between external pulses with a typical resolution of 300 ps.

Uses for the HRCAP include:

- Capacitive touch applications
- High-resolution period and duty cycle measurements of pulse train cycles
- Instantaneous speed measurements
- Instantaneous frequency measurements
- Reading the feedback across an isolation boundary
- Distance/sonar measurement and scanning

The HRCAP module features include:

- Pulse width capture in either non-high-resolution or high-resolution modes
- Difference (Delta) mode pulse width capture
- Typical high-resolution capture on the order of 300 ps resolution
- Interrupt on either falling or rising edge
- Continuous mode capture of pulse widths in 2-deep buffer
- Calibration logic for precision high-resolution capture
- All of the above resources are dedicated to a single input pin
- HRCAP calibration software library supplied by TI is used for both calibration and calculating fractional pulse widths

The HRCAP module includes one capture channel in addition to a high-resolution calibration block, which connects internally to an HRPWM channel when calibrating.

Each HRCAP channel has the following independent key resources:

- Dedicated input capture pin
- 16-bit HRCAP clock which is either equal to the PLL output frequency (asynchronous to SYSCLKOUT) or equal to the SYSCLKOUT frequency (synchronous to SYSCLKOUT)
- High-resolution pulse width capture in a 2-deep buffer

Figure 6-44. HRCAP Functional Block Diagram

6.21 Enhanced Quadrature Encoder Modules (eQEP1/2)

The device contains up to two enhanced quadrature encoder (eQEP) modules. [Table 6-59](#) provides a summary of the eQEP registers.

Table 6-59. eQEP Control and Status Registers

Table 6-61. eQEP Switching Characteristics

PARAMETER		TEST CONDITIONS	MIN	MAX	UNIT
$t_{d(CNTR)_{xin}}$	Delay time, external clock to counter increment			$4t_{c(SCO)}$	cycles
$t_{d(PCS-OUT)_{QEP}}$	Delay time, QEP input edge to position compare sync output			$6t_{c(SCO)}$	cycles

6.22 JTAG Port

On the 2806x device, the JTAG port is reduced to 5 pins ($\overline{\text{TRST}}$, TCK, TDI, TMS, TDO). TCK, TDI, TMS and TDO pins are also GPIO pins. The $\overline{\text{TRST}}$ signal selects either JTAG or GPIO operating mode for the pins in Figure 6-46. During emulation/debug, the GPIO function of these pins are not available. If the GPIO38/TCK/XCLKIN pin is used to provide an external clock, an alternate clock source should be used to clock the device during emulation/debug since this pin will be needed for the TCK function.

NOTE

In 2806x devices, the JTAG pins may also be used as GPIO pins. Care should be taken in the board design to ensure that the circuitry connected to these pins do not affect the emulation capabilities of the JTAG pin function. Any circuitry connected to these pins should not prevent the emulator from driving (or being driven by) the JTAG pins for successful debug.

Figure 6-46. JTAG/GPIO Multiplexing

6.23 General-Purpose Input/Output (GPIO) MUX

The GPIO MUX can multiplex up to three independent peripheral signals on a single GPIO pin in addition to providing individual pin bit-banging I/O capability.

The device supports 45 GPIO pins. The GPIO control and data registers are mapped to Peripheral Frame 1 to enable 32-bit operations on the registers (along with 16-bit operations). [Table 6-62](#) shows the GPIO register mapping.

Table 6-62. GPIO Registers

(1) I = Input, O = Output

The user can select the type of input qualification for each GPIO pin via the GPxQSEL1/2 registers from four choices:

- Synchronization To SYSCLKOUT Only (GPxQSEL1/2 = 0, 0): This is the default mode of all GPIO pins at reset and it simply synchronizes the input signal to the system clock (SYSCLKOUT).
- Qualification Using Sampling Window (GPxQSEL1/2 = 0, 1 and 1, 0): In this mode the input signal, after synchronization to the system clock (SYSCLKOUT), is qualified by a specified number of cycles before the input is allowed to change.
- The sampling period is specified by the QUALPRD bits in the GPxCTRL register and is configurable in groups of 8 signals. It specifies a multiple of SYSCLKOUT cycles for sampling the input signal. The sampling window is either 3-samples or 6-samples wide and the output is only changed when ALL samples are the same (all 0s or all 1s) as shown in Figure 4-18 (for 6 sample mode).
- No Synchronization (GPxQSEL1/2 = 1,1): This mode is used for peripherals where synchronization is not required (synchronization is performed within the peripheral).

Due to the multi-level multiplexing that is required on the device, there may be cases where a peripheral input signal can be mapped to more than one GPIO pin. Also, when an input signal is not selected, the input signal will default to either a 0 or 1 state, depending on the peripheral.

■ = Default at Reset

- A. x stands for the port, either A or B. For example, GPxDIR refers to either the GPADIR and GPBDIR register depending on the particular GPIO pin selected.
- B. GPxDAT latch/read are accessed at the same memory location.
- C. This is a generic GPIO MUX block diagram. Not all options may be applicable for all GPIO pins. See the "Systems Control and Interrupts" chapter of the *TMS320x2806x Piccolo Technical Reference Manual* (literature number [SPRUH18](#)) for pin-specific variations.

		QUALPRD \neq 0		$2t_{c(SCO)} * QUALPRD$	cycles
$t_{w(IQSW)}$	Input qualifier sampling window			$t_{w(SP)} * (n^{(1)} - 1)$	cycles
$t_{w(GPI)}^{(2)}$	Pulse duration, GPIO low/high	Synchronous mode		$2t_{c(SCO)}$	cycles
		With input qualifier		$t_{w(IQSW)} + t_{w(SP)} + 1t_{c(SCO)}$	cycles

(1) "n" represents the number of qualification samples as defined by GPxQSELn register.

(2) For $t_{w(GPI)}$, pulse width is measured from V_{IL} to V_{IL} for an active-low signal and V_{IH} to V_{IH} for an active-high signal.

- A. This glitch will be ignored by the input qualifier. The QUALPRD bit field specifies the qualification sampling period. It can vary from 00 to 0xFF. If QUALPRD = 00, then the sampling period is 1 SYSCLKOUT cycle. For any other value "n", the qualification sampling period is 2n SYSCLKOUT cycles (i.e., at every 2n SYSCLKOUT cycles, the GPIO pin will be sampled).
- B. The qualification period selected via the GPxCTRL register applies to groups of 8 GPIO pins.
- C. The qualification block can take either three or six samples. The GPxQSELn Register selects which sample mode is used.
- D. In the example shown, for the qualifier to detect the change, the input should be stable for 10 SYSCLKOUT cycles or greater. In other words, the inputs should be stable for (5 x QUALPRD x 2) SYSCLKOUT cycles. This would ensure 5 sampling periods for detection to occur. Since external signals are driven asynchronously, an 13-SYCLKOUT-wide pulse ensures reliable recognition.

Figure 6-49. Sampling Mode

ADVANCE INFORMATION

6.23.1.3 Sampling Window Width for Input Signals

The following section summarizes the sampling window width for input signals for various input qualifier configurations.

Sampling frequency denotes how often a signal is sampled with respect to SYSCLKOUT.

Sampling frequency = $\text{SYSCLKOUT} / (2 * \text{QUALPRD})$, if $\text{QUALPRD} \neq 0$

Sampling frequency = SYSCLKOUT , if $\text{QUALPRD} = 0$

Sampling period = $\text{SYSCLKOUT cycle} \times 2 \times \text{QUALPRD}$, if $\text{QUALPRD} \neq 0$

In the above equations, SYSCLKOUT cycle indicates the time period of SYSCLKOUT.

Sampling period = SYSCLKOUT cycle , if $\text{QUALPRD} = 0$

In a given sampling window, either 3 or 6 samples of the input signal are taken to determine the validity of the signal. This is determined by the value written to GPxQSELn register.

Case 1:

Qualification using 3 samples

Sampling window width = $(\text{SYSCLKOUT cycle} \times 2 \times \text{QUALPRD}) \times 2$, if $\text{QUALPRD} \neq 0$

Sampling window width = $(\text{SYSCLKOUT cycle}) \times 2$, if $\text{QUALPRD} = 0$

Case 2:

Qualification using 6 samples

Sampling window width = $(\text{SYSCLKOUT cycle} \times 2 \times \text{QUALPRD}) \times 5$, if $\text{QUALPRD} \neq 0$

Sampling window width = $(\text{SYSCLKOUT cycle}) \times 5$, if $\text{QUALPRD} = 0$

Figure 6-50. General-Purpose Input Timing

6.23.1.4 Low-Power Mode Wakeup Timing

Table 6-68 shows the timing requirements, Table 6-69 shows the switching characteristics, and Figure 6-51 shows the timing diagram for IDLE mode.

Table 6-68. IDLE Mode Timing Requirements⁽¹⁾

		MIN	NOM	MAX	UNIT
$t_{w(WAKE-INT)}$	Pulse duration, external wake-up signal	Without input qualifier			cycles
		With input qualifier			
		$2t_{c(SCO)}$			
		$5t_{c(SCO)} + t_{w(IQSW)}$			

(1) For an explanation of the input qualifier parameters, see Table 6-67.

Table 6-69. IDLE Mode Switching Characteristics⁽¹⁾

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$t_{d(WAKE-IDLE)}$	Delay time, external wake signal to program execution resume ⁽²⁾					cycles
	• Wake-up from Flash – Flash module in active state	Without input qualifier			$20t_{c(SCO)}$	cycles
		With input qualifier			$20t_{c(SCO)} + t_{w(IQSW)}$	
	• Wake-up from Flash – Flash module in sleep state	Without input qualifier			$1050t_{c(SCO)}$	cycles
		With input qualifier			$1050t_{c(SCO)} + t_{w(IQSW)}$	
	• Wake-up from SARAM	Without input qualifier			$20t_{c(SCO)}$	cycles
With input qualifier				$20t_{c(SCO)} + t_{w(IQSW)}$		

(1) For an explanation of the input qualifier parameters, see Table 6-67.

(2) This is the time taken to begin execution of the instruction that immediately follows the IDLE instruction. execution of an ISR (triggered by the wake-up) signal involves additional latency.

- A. WAKE INT can be any enabled interrupt, \overline{WDINT} or \overline{XRS} . After the IDLE instruction is executed, a delay of 5 OSCCLK cycles (minimum) is needed before the wake-up signal could be asserted.
- B. From the time the IDLE instruction is executed to place the device into low-power mode (LPM), wakeup should not be initiated until at least 4 OSCCLK cycles have elapsed.

Figure 6-51. IDLE Entry and Exit Timing

Table 6-70. STANDBY Mode Timing Requirements

		TEST CONDITIONS	MIN	NOM	MAX	UNIT
$t_{w(WAKE-INT)}$	Pulse duration, external wake-up signal	Without input qualification	$3t_{c(OSCCLK)}$			cycles
		With input qualification ⁽¹⁾	$(2 + QUALSTDBY) * t_{c(OSCCLK)}$			

(1) QUALSTDBY is a 6-bit field in the LPMCR0 register.

Table 6-71. STANDBY Mode Switching Characteristics

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$t_{d(IDLE-XCOL)}$	Delay time, IDLE instruction executed to XCLKOUT low		$32t_{c(SCO)}$		$45t_{c(SCO)}$	cycles
$t_{d(WAKE-STBY)}$	Delay time, external wake signal to program execution resume ⁽¹⁾					cycles
	<ul style="list-style-type: none"> Wake up from flash <ul style="list-style-type: none"> Flash module in active state 	Without input qualifier			$100t_{c(SCO)}$	cycles
		With input qualifier			$100t_{c(SCO)} + t_{w(WAKE-INT)}$	
	<ul style="list-style-type: none"> Wake up from flash <ul style="list-style-type: none"> Flash module in sleep state 	Without input qualifier			$1125t_{c(SCO)}$	cycles
		With input qualifier			$1125t_{c(SCO)} + t_{w(WAKE-INT)}$	
	<ul style="list-style-type: none"> Wake up from SARAM 	Without input qualifier			$100t_{c(SCO)}$	cycles
With input qualifier				$100t_{c(SCO)} + t_{w(WAKE-INT)}$		

(1) This is the time taken to begin execution of the instruction that immediately follows the IDLE instruction. execution of an ISR (triggered by the wake up signal) involves additional latency.

- A. IDLE instruction is executed to put the device into STANDBY mode.
- B. The PLL block responds to the STANDBY signal. SYSCLKOUT is held for the number of cycles indicated below before being turned off:
 - 16 cycles, when DIVSEL = 00 or 01
 - 32 cycles, when DIVSEL = 10
 - 64 cycles, when DIVSEL = 11
 This delay enables the CPU pipeline and any other pending operations to flush properly.
- C. Clock to the peripherals are turned off. However, the PLL and watchdog are not shut down. The device is now in STANDBY mode. After the IDLE instruction is executed, a delay of 5 OSCCLK cycles (minimum) is needed before the wake-up signal could be asserted.
- D. The external wake-up signal is driven active.
- E. The wake-up signal fed to a GPIO pin to wake up the device must meet the minimum pulse width requirement. Furthermore, this signal must be free of glitches. If a noisy signal is fed to a GPIO pin, the wake-up behavior of the device will not be deterministic and the device may not exit low-power mode for subsequent wake-up pulses.
- F. After a latency period, the STANDBY mode is exited.
- G. Normal execution resumes. The device will respond to the interrupt (if enabled).
- H. From the time the IDLE instruction is executed to place the device into low-power mode (LPM), wakeup should not be initiated until at least 4 OSCCLK cycles have elapsed.

Figure 6-52. STANDBY Entry and Exit Timing Diagram

Table 6-72. HALT Mode Timing Requirements

		MIN	NOM	MAX	UNIT
$t_{w(\text{WAKE-GPIO})}$	Pulse duration, GPIO wake-up signal			$t_{\text{oscst}} + 2t_{\text{c}(\text{OSCCLK})}$	cycles
$t_{w(\text{WAKE-XRS})}$	Pulse duration, $\overline{\text{XRS}}$ wakeup signal			$t_{\text{oscst}} + 8t_{\text{c}(\text{OSCCLK})}$	cycles

Table 6-73. HALT Mode Switching Characteristics

PARAMETER		MIN	TYP	MAX	UNIT
$t_{d(\text{IDLE-XCOL})}$	Delay time, IDLE instruction executed to XCLKOUT low	$32t_{\text{c}(\text{SCO})}$		$45t_{\text{c}(\text{SCO})}$	cycles
t_p	PLL lock-up time			1	ms
$t_{d(\text{WAKE-HALT})}$	Delay time, PLL lock to program execution resume				
	<ul style="list-style-type: none"> • Wake up from flash – Flash module in sleep state 			$1125t_{\text{c}(\text{SCO})}$	cycles
	<ul style="list-style-type: none"> • Wake up from SARAM 			$35t_{\text{c}(\text{SCO})}$	cycles

- A. IDLE instruction is executed to put the device into HALT mode.
- B. The PLL block responds to the HALT signal. SYSCLKOUT is held for the number of cycles indicated below before oscillator is turned off and the CLKIN to the core is stopped:
 - 16 cycles, when DIVSEL = 00 or 01
 - 32 cycles, when DIVSEL = 10
 - 64 cycles, when DIVSEL = 11
 This delay enables the CPU pipeline and any other pending operations to flush properly.
- C. Clocks to the peripherals are turned off and the PLL is shut down. If a quartz crystal or ceramic resonator is used as the clock source, the internal oscillator is shut down as well. The device is now in HALT mode and consumes absolute minimum power. It is possible to keep the zero-pin internal oscillators (INTOSC1 and INTOSC2) and the watchdog alive in HALT mode. This is done by writing to the appropriate bits in the CLKCTL register. After the IDLE instruction is executed, a delay of 5 OSCCLK cycles (minimum) is needed before the wake-up signal could be asserted.
- D. When the GPIO pin (used to bring the device out of HALT) is driven low, the oscillator is turned on and the oscillator wake-up sequence is initiated. The GPIO pin should be driven high only after the oscillator has stabilized. This enables the provision of a clean clock signal during the PLL lock sequence. Since the falling edge of the GPIO pin asynchronously begins the wakeup procedure, care should be taken to maintain a low noise environment prior to entering and during HALT mode.
- E. The wake-up signal fed to a GPIO pin to wake up the device must meet the minimum pulse width requirement. Furthermore, this signal must be free of glitches. If a noisy signal is fed to a GPIO pin, the wake-up behavior of the device will not be deterministic and the device may not exit low-power mode for subsequent wake-up pulses.
- F. Once the oscillator has stabilized, the PLL lock sequence is initiated, which takes 1 ms.
- G. When CLKIN to the core is enabled, the device will respond to the interrupt (if enabled), after a latency. The HALT mode is now exited.
- H. Normal operation resumes.
- I. From the time the IDLE instruction is executed to place the device into low-power mode (LPM), wakeup should not be initiated until at least 4 OSCCLK cycles have elapsed.

Table 6-74. Flash/OTP Endurance for T Temperature Material⁽¹⁾

		ERASE/PROGRAM TEMPERATURE	MIN	TYP	MAX	UNIT
N_f	Flash endurance for the array (write/erase cycles)	0°C to 105°C (ambient)	20000	50000		cycles
N_{OTP}	OTP endurance for the array (write cycles)	0°C to 30°C (ambient)			1	write

(1) Write/erase operations outside of the temperature ranges indicated are not specified and may affect the endurance numbers.

Table 6-75. Flash/OTP Endurance for S Temperature Material⁽¹⁾

		ERASE/PROGRAM TEMPERATURE	MIN	TYP	MAX	UNIT
N_f	Flash endurance for the array (write/erase cycles)	0°C to 125°C (ambient)	20000	50000		cycles
N_{OTP}	OTP endurance for the array (write cycles)	0°C to 30°C (ambient)			1	write

(1) Write/erase operations outside of the temperature ranges indicated are not specified and may affect the endurance numbers.

Table 6-76. Flash/OTP Endurance for Q Temperature Material⁽¹⁾

		ERASE/PROGRAM TEMPERATURE	MIN	TYP	MAX	UNIT
N_f	Flash endurance for the array (write/erase cycles)	–40°C to 125°C (ambient)	20000	50000		cycles
N_{OTP}	OTP endurance for the array (write cycles)	–40°C to 30°C (ambient)			1	write

(1) Write/erase operations outside of the temperature ranges indicated are not specified and may affect the endurance numbers.

Table 6-77. Flash Parameters at 80-MHz SYSCLKOUT

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Program Time	16-Bit Word			50		μs
	8K Sector			250		ms
	4K Sector			125		ms
Erase Time	8K Sector			2		s
	4K Sector			2		s
I_{DDP} ⁽¹⁾	V_{DD} current consumption during Erase/Program cycle	VREG disabled		80		mA
I_{DDIOP} ⁽¹⁾	V_{DDIO} current consumption during Erase/Program cycle			60		
I_{DDIOP} ⁽¹⁾	V_{DDIO} current consumption during Erase/Program cycle	VREG enabled		120		mA

(1) Typical parameters as seen at room temperature including function call overhead, with all peripherals off.

Table 6-78. Flash/OTP Access Timing

PARAMETER		MIN	MAX	UNIT
$t_{a(fp)}$	Paged Flash access time	40		ns
$t_{a(fr)}$	Random Flash access time	40		ns
$t_{a(OTP)}$	OTP access time	60		ns

Table 6-79. Minimum Required Flash/OTP Wait-States at Different Frequencies

SYCLKOUT (MHz)	SYCLKOUT (ns)	PAGE WAIT-STATE ⁽¹⁾	RANDOM WAIT-STATE ⁽¹⁾	OTP WAIT-STATE
60	16.67	2	2	3
55	18.18	2	2	3
50	20	1	1	2
45	22.22	1	1	2
40	25	1	1	2
35	28.57	1	1	2
30	33.33	1	1	1

(1) Page and random wait-state must be ≥ 1.

The equations to compute the Flash page wait-state and random wait-state in [Table 6-79](#) are as follows:

$$\text{Flash Page Wait State} = \left\lceil \left(\frac{t_{a(f.p)}}{t_{c(SCO)}} \right) - 1 \right\rceil \text{ round up to the next highest integer, or 1, whichever is larger}$$

$$\text{Flash Random Wait State} = \left\lceil \left(\frac{t_{a(f.r)}}{t_{c(SCO)}} \right) - 1 \right\rceil \text{ round up to the next highest integer, or 1, whichever is larger}$$

The equation to compute the OTP wait-state in [Table 6-79](#) is as follows:

$$\text{OTP Wait State} = \left\lceil \left(\frac{t_{a(OTP)}}{t_{c(SCO)}} \right) - 1 \right\rceil \text{ round up to the next highest integer, or 1, whichever is larger}$$

7.1.1 Thermal Design Considerations

Based on the end application design and operational profile, the I_{DD} and I_{DDIO} currents could vary. Systems that exceed the recommended maximum power dissipation in the end product may require additional thermal enhancements. Ambient temperature (T_A) varies with the end application and product design. The critical factor that affects reliability and functionality is T_J , the junction temperature, not the ambient temperature. Hence, care should be taken to keep T_J within the specified limits. T_{case} should be measured to estimate the operating junction temperature T_J . T_{case} is normally measured at the center of the package top-side surface. The thermal application reports *IC Package Thermal Metrics* (literature number [SPRA953](#)) and *Reliability Data for TMS320LF24xx and TMS320F28xx Devices* (literature number [SPRA963](#)) help to understand the thermal metrics and definitions.

7.2 Packaging Information

The following packaging information and addendum reflect the most current data available for the designated device(s). This data is subject to change without notice and without revision of this document.

THERMAL PAD MECHANICAL DATA

PFP (S-PQFP-G80)

PowerPAD™ PLASTIC QUAD FLATPACK

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
