

## Wide Input Voltage Range 10\_mA Ultra-Low Iq

### High PSRR Linear Regulator

The ZCC2785 is a high-performance linear regulator, offering a very wide operating input voltage range of up to 450 V DC, with an output current of up to 10 mA.

Ideal for high input voltage applications such as industrial and home metering, home appliances. The ZCC2785 family offers  $\pm 5\%$  initial accuracy, extremely high-power supply rejection ratio and ultra-low quiescent current. The ZCC2785 is optimized for high-voltage line and load transients, making this part ideal for harsh environment applications.

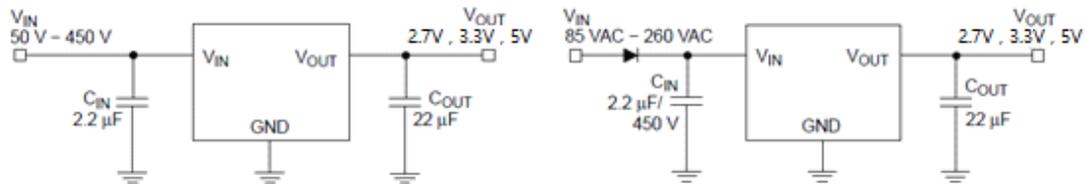

The ZCC2785 is offered in fixed output voltage options 2.7V, 3.3 V, and 5.0 V. ESOP8 package offers good thermal performance and help to minimize the solution size.

### Features

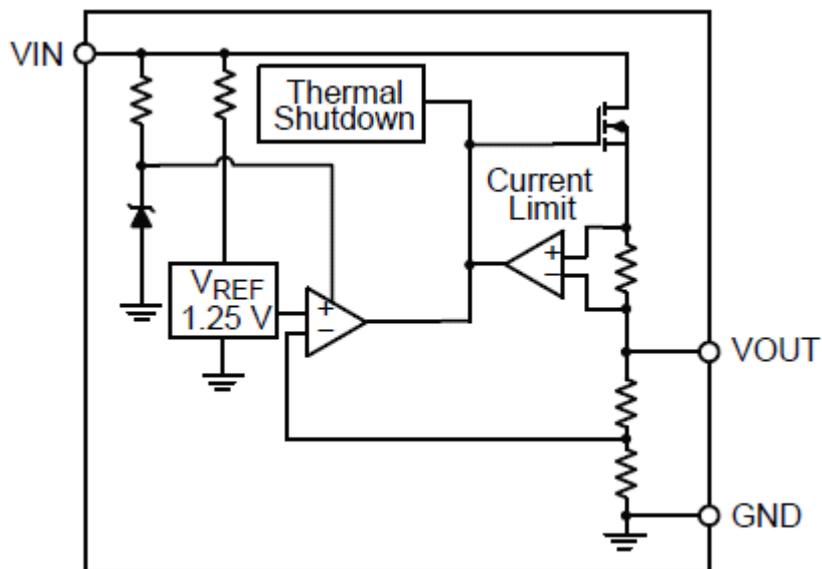

- Wide Input Voltage Range:
  - DC: Up to 450 V
  - AC: 85 V to 260 V (half-wave rectifier and 2.2  $\mu$ F capacitor)
- 10 mA Guaranteed Output Current
- Ultra Low Quiescent Current: Typ. 10  $\mu$ A ( $V_{OUT} \leq 5$  V)
- $\pm 5\%$  Accuracy Over Full Load, Line and Temperature Variations
- Ultra-high PSRR: 70 dB at 60 Hz, 90 dB at 100 kHz
- Stable with Ceramic Output Capacitor 22  $\mu$ F MLCC
- Thermal Shutdown and Current Limit Protection
- Available in Thermally Enhanced ESOP8 Package
- This is a Pb-Free Device

## Typical Applications

- Industrial Applications, Home Appliances
- Home Metering / Network Application
- Off-line Power Supplies

**Figure 1. Typical Applications**

## APPLICATION INFORMATION

The typical application circuit for the ZCC2785 device is shown below.

**Figure 3. Typical Application Schematic**

### Input Decoupling (C1)

A  $1\mu\text{F}$  capacitor either ceramic or electrolytic is recommended and should be connected close to the input pin of ZCC2785. Higher value  $2.2\mu\text{F}$  is necessary to sustain the required minimum input voltage at full load for AC voltage as low as  $85\text{ V}$  with half wave rectifier.

## **Output Decoupling (C2)**

The ZCC2785 Regulator does not require any specific Equivalent Series Resistance (ESR). Thus capacitors exhibiting ESRs ranging from a few  $m\Omega$  up to  $0.5\Omega$  can be used safely. The minimum decoupling value is  $22\mu F$ . The regulator accepts ceramic chip capacitors as well as tantalum devices or low ESR electrolytic capacitors. Larger values improve noise rejection and load transient response.

## **Layout Recommendations**

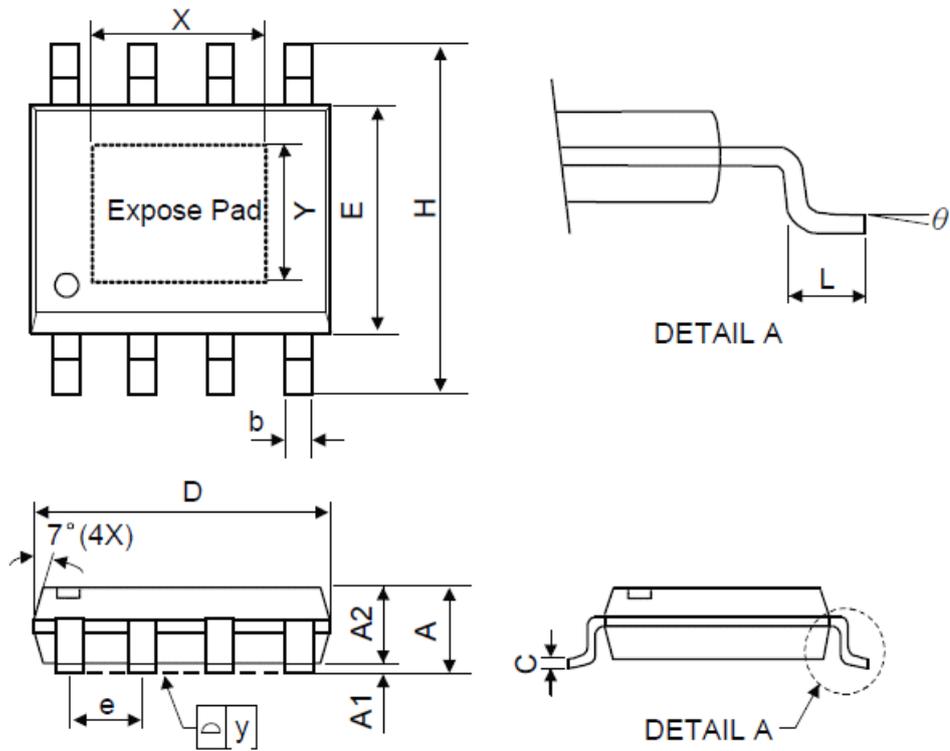

Please be sure the VIN and GND lines are sufficiently wide. When the impedance of these lines is high, there is a chance to pick up noise or to cause the malfunction of regulator.

Set external components, especially the output capacitor, as close as possible to the circuit, and make leads as short as possible.

## **Thermal**

As power across the ZCC2785 increases, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design layout and used package. Mounting pad configuration on the PCB, the board material, and also the ambient temperature affect the rate of temperature rise for the part. This is stating that when the ZCC2785 has good thermal conductivity through the PCB, the junction temperature will be relatively low with high power dissipation applications.
