

650V SuperGaN® FET in PQFN (source tab)

Description

The TP65H300G4LSG 650V, 240 mΩ gallium nitride (GaN) FET is a normally-off device using Transphorm's Gen IV platform. It combines a state-of-the-art high voltage GaN HEMT with a low voltage silicon MOSFET to offer superior reliability and performance.

The Gen IV SuperGaN® platform uses advanced epi and patented design technologies to simplify manufacturability while improving efficiency over silicon via lower gate charge, output capacitance, crossover loss, and reverse recovery charge.

Features

- JEDEC-qualified GaN technology
- Dynamic $R_{DS(on)}$ production tested
- Robust design, defined by
 - Intrinsic lifetime tests
 - Wide gate safety margin
 - Transient over-voltage capability
- Enhanced inrush current capability
- Very low Q_{RR}
- Reduced crossover loss

Benefits

- Enables AC-DC bridgeless totem-pole PFC designs
 - Increased power density
 - Reduced system size and weight
 - Overall lower system cost
- Achieves increased efficiency in both hard- and soft-switched circuits
- Easy to drive with commonly-used gate drivers
- GSD pin layout improves high speed design

Circuit Implementation

Simplified Half-bridge Schematic

Simplified Single Ended Schematic

Recommended gate drive: (0V, 8V) with $R_{G(\text{tot})} = 30\text{--}60 \Omega^a$

Recommended gate drive: (0V, 12V) with $R_{G(\text{ON})} = 100$ to 300Ω
 $R_{G(\text{OFF})} = 0$ to 15Ω

Gate Ferrite Bead (FB1)	Required DC Link RC Snubber (RC_{DCL}) ^b
240Ω@100MHz	4.7-10nF + 5Ω

Notes:

- a. For bridge topologies only. R_G could be much smaller in single ended topologies.
- b. RC_{DCL} should be placed as close as possible to the drain pin.

Design Considerations

The fast switching of GaN devices reduces current-voltage crossover losses and enables high frequency operation while simultaneously achieving high efficiency. However, taking full advantage of the fast switching characteristics of GaN switches requires adherence to specific PCB layout guidelines and probing techniques.

Before evaluating Transphorm GaN devices, see application note [Printed Circuit Board Layout and Probing for GaN Power Switches](#). The table below provides some practical rules that should be followed during the evaluation.

When Evaluating Transphorm GaN Devices:

DO	DO NOT
Minimize circuit inductance by keeping traces short, both in the drive and power loop	Twist the pins of TO-220 or TO-247 to accommodate GDS board layout
Minimize lead length of TO-220 and TO-247 package when mounting to the PCB	Use long traces in drive circuit, long lead length of the devices
Use shortest sense loop for probing; attach the probe and its ground connection directly to the test points	Use differential mode probe or probe ground clip with long wire
See AN0003 : Printed Circuit Board Layout and Probing
